# Interoperability Process Reference Manual (IPRM)

## 84 1.0 Introduction

85 One of the major issues facing the Smart Grid community to-date is unacceptable levels of product  
86 interoperability with products claiming to be certified to common standards-based communication  
87 technologies. This poor level of product interoperability formed the basis in which the Smart Grid  
88 Testing and Certification Committee (SGTCC) was tasked by the Smart Grid Interoperability Panel  
89 (SGIP) to create “the necessary documentation and organizational framework for compliance, in-  
90 teroperability and cyber security testing and certification”. The SGTCC determined that an Interop-  
91 erability Process Reference Manual (IPRM) was a critical part of this framework.

92

93 The IPRM outlines the conformance, interoperability and cyber-security testing and certification  
94 requirements for SGIP-recommended Smart Grid standards. This document has been designed to  
95 capture testing and certification processes and best practices needed to verify product interopera-  
96 bility amongst two or more products using the same standards-based communications technology.  
97 These processes and best practices are intended for use by an Interoperability Testing and Certifi-  
98 cation Authority (ITCA) in the design and management of a testing and certification program.

99

100 This IPRM focuses on describing the functions and responsibilities of the ITCA, but does not pro-  
101 pose an organizational structure since it will vary based on the standard and standard's market-  
102 place.

# Interoperability Process Reference Manual (IPRM)

## 103 2.0 Purpose

104 The IPRM outlines the role of an ITCA and specifies the testing and certification processes associ-  
105 ated with achieving interoperability for a specific Smart Grid standard. The IPRM is intended for  
106 adoption by any ITCA that is responsible for coordinating testing and certification of a Smart Grid  
107 technology standard. Mandatory requirements are denoted by the keyword “shall”, and other rec-  
108 ommended best practices are denoted with keywords “should, must or may”.

109  
110 In the context of interoperability, product certification is intended to provide high confidence that a  
111 product, when integrated and operated within the Smart Grid, will function as stated under specific  
112 business conditions and / or criteria. The IPRM defines criteria, recommendations and guidelines  
113 for product interoperability and conformance certification. It is important to understand “Interopera-  
114 bility” has no meaning for a single product but for a relationship among two or more products. Al-  
115 ternatively, conformance does have meaning for one product as it applies to its meeting the re-  
116 quirements of the standard or test profile. Conformance testing alone does not guarantee interoper-  
117 erable products and interoperability testing does not necessarily mean that products are confor-  
118 mant to the standard. Conformance testing increases the likelihood that products will be interoper-  
119 able and is typically a pre-cursor to interoperability testing. The IPRM requires that a certified in-  
120 teroperable product shall conform to a standard or profile of the standard.

121

# Interoperability Process Reference Manual (IPRM)

## 122 3.0 Intended Audience

123 The IPRM is to be used by the ITCA in its role in managing the interoperability testing and certifica-  
124 tion processes of Smart Grid standards based products. While standards-based products can  
125 reach the market-place and eventually be interoperable, many standards require organizations  
126 whose sole function is to drive and coordinate adoption from a business and marketing point of  
127 view. The function of the ITCA is to increase the adoption rate by bringing together end-users,  
128 vendors, test labs and certification bodies with the goal of reducing lead times associated with  
129 standards development and the subsequent provision of interoperable products in the market-  
130 place.

131

132 While the IPRM's audience is the ITCA, it recognizes that many parties will actively participate in  
133 the generic product interoperability certification processes. In particular, the following major actors  
134 are involved with the evolution of interoperable standards based technologies:

- 135 • Product and System Integrators
- 136 • Product Developers and Vendors
- 137 • SSOs - developing interoperability standards
- 138 • Interoperability Testing and Certification Authority
- 139 • Testing Laboratories
- 140 • Certification Bodies
- 141 • Customers/users of the products

# Interoperability Process Reference Manual (IPRM)

## 142 4.0 Scope

143

144 The IPRM assumes an ITCA is established for a given standard and addresses responsibilities of  
145 that ITCA. Some activities associated with ITCA include:

- 146 • Designing, developing and managing a testing and certification program
- 147 • Monitoring and enforcing testing and certification policies and procedures
- 148 • Managing relationships between various actors and stakeholders
- 149 • Managing conformance and interoperability assessments in the course of standard crea-  
150 tion

151 It should be noted that ITCAs do not currently exist for all Smart Grid interoperability standards. As  
152 a result, new ones will need to be organized to coordinate and help drive adoption of specific stan-  
153 dards. While the IPRM can help new ITCAs in establishing their policies and best practices, it does  
154 not address the process by which an ITCA is formed.

# Interoperability Process Reference Manual (IPRM)

## 155 5.0 Overview

156

157 The overview provided in this section will assist in clarifying the goals and requirements of the Inter-  
158 operability Process Reference Manual (IPRM).

159

### 160 5.1 IPRM Model for Product Testing and Certification

161 The testing of products involves the transformation of use-case scenarios into an appropri-  
162 ate set of testing scenarios. Figure 1 depicts the process of transforming product use  
163 cases into a set of test scenarios which will be used to define an application test profile  
164 group<sup>1</sup>. A product vendor instantiates the application test profile group by building a par-  
165 ticular hardware or software solution. As a rule, product vendors attest to the supported  
166 feature set by way of the proforma (e.g. protocol and / or profile) implementation confor-  
167 mance statement (PICS)<sup>3</sup>. PICS documents, together with the test specification and the  
168 most up-to-date applicable tests as maintained on the Test Case Reference List (TCRL)<sup>3</sup>,  
169 produce a Test Plan for a particular testing campaign<sup>3</sup>.

---

<sup>1</sup> Application test profile group is the set of test profile categories (the folders in the picture) that form the totality of a series of tests that correspond to verification of the application profile feature set.

# Interoperability Process Reference Manual (IPRM)

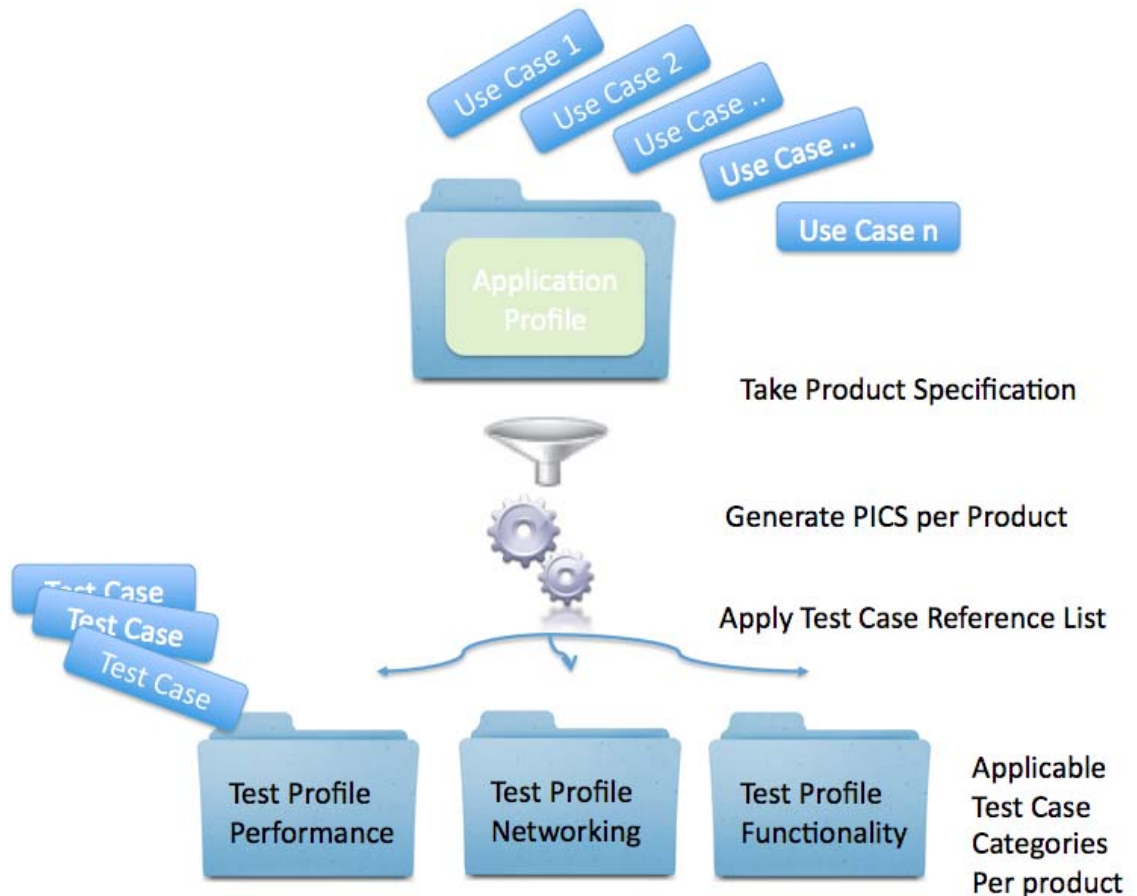

Figure 1 – Use Case to Test Case Transformation

170

171

172

173

The application test profile group is used to develop test plans with the intent of directing a test laboratory in executing the appropriate product tests within each of the test profile categories. A set of conformance tests is generally required during the testing process, and applies to different layers of a product.

177

178

In Figure 2, the 7-layer Open Systems Interconnection (OSI) model illustrates the communication network environment for a product. Generally, both hardware and software products fit into this communication application architecture model and their specific test profiles

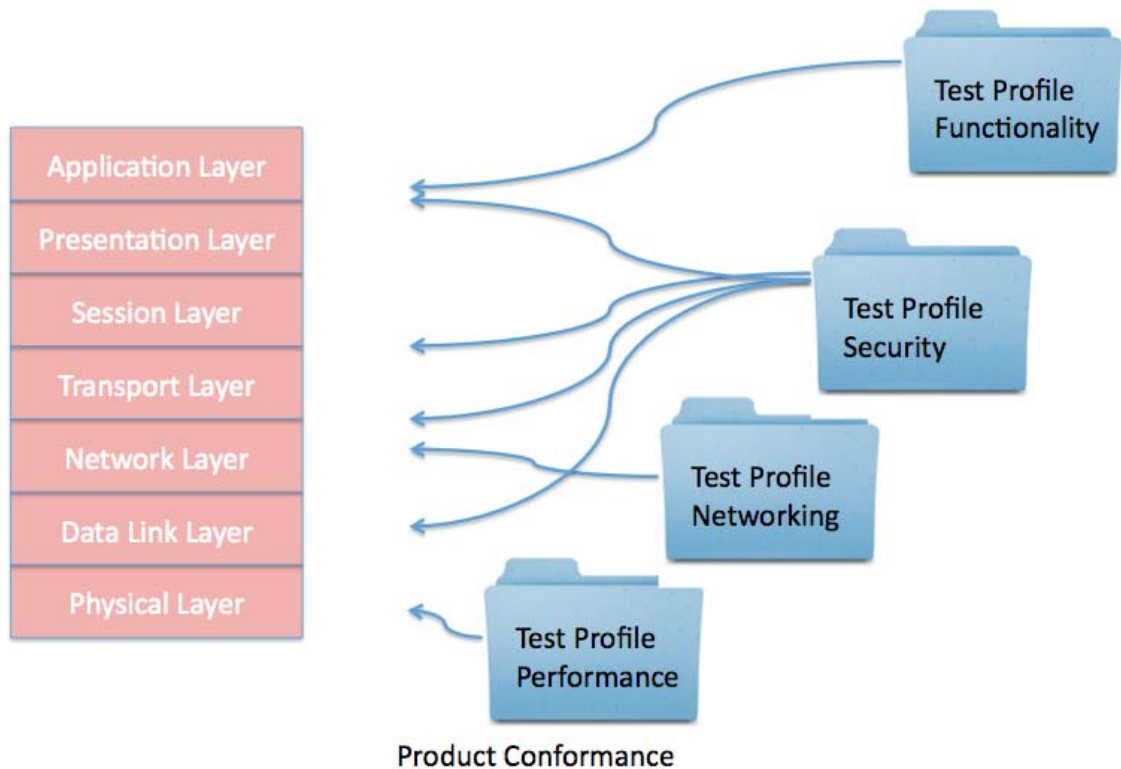

179

180

# Interoperability Process Reference Manual (IPRM)

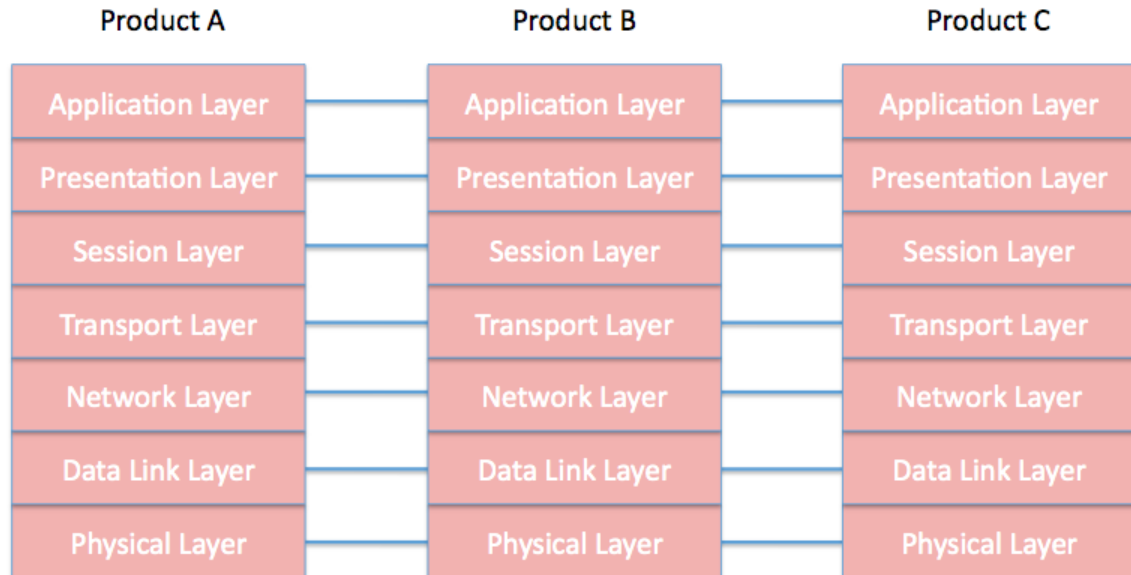

181 relate directly to a respective layer of the OSI model. Each specific test profile will generally  
182 use a test setup or "test harness"<sup>3</sup>. It is the role of the ITCA to determine the technical vi-  
183 ability of using test harnesses for the product interoperability testing processes.  
184

185  
186 **Figure 2 – 7 Layer OSI Model Mapped To Product Testing Profiles**  
187 Prior to interoperability testing, a product is tested for conformance to the specification at  
188 each relevant OSI layer.  
189

# Interoperability Process Reference Manual (IPRM)

## Product Interoperability

190

191

**Figure 3 – Product Interoperability Correlations At Each Relevant OSI Layer**

192

193

As depicted in Figure 3, product interoperability testing involves hardware and / or software products (e.g. product A, B and C) intercommunicating at each relevant OSI layer. With this depiction, product A may be part of a validated test harness and therefore treated as a “golden unit”. The introduction of golden units (i.e. actual production market devices) in a testing program is made at the discretion of the ITCA. Generally, product conformance testing is a pre-requisite for product level interoperability.

199

200

The set of conformance and product interoperability tests help define a testing program for Smart Grid solutions, and is applicable to both hardware and software products. A typical set-up in the communication industry is the alignment of a testing program with the specific test profiles. As noted previously conformance testing is in general “orthogonal”, or sepa-

201

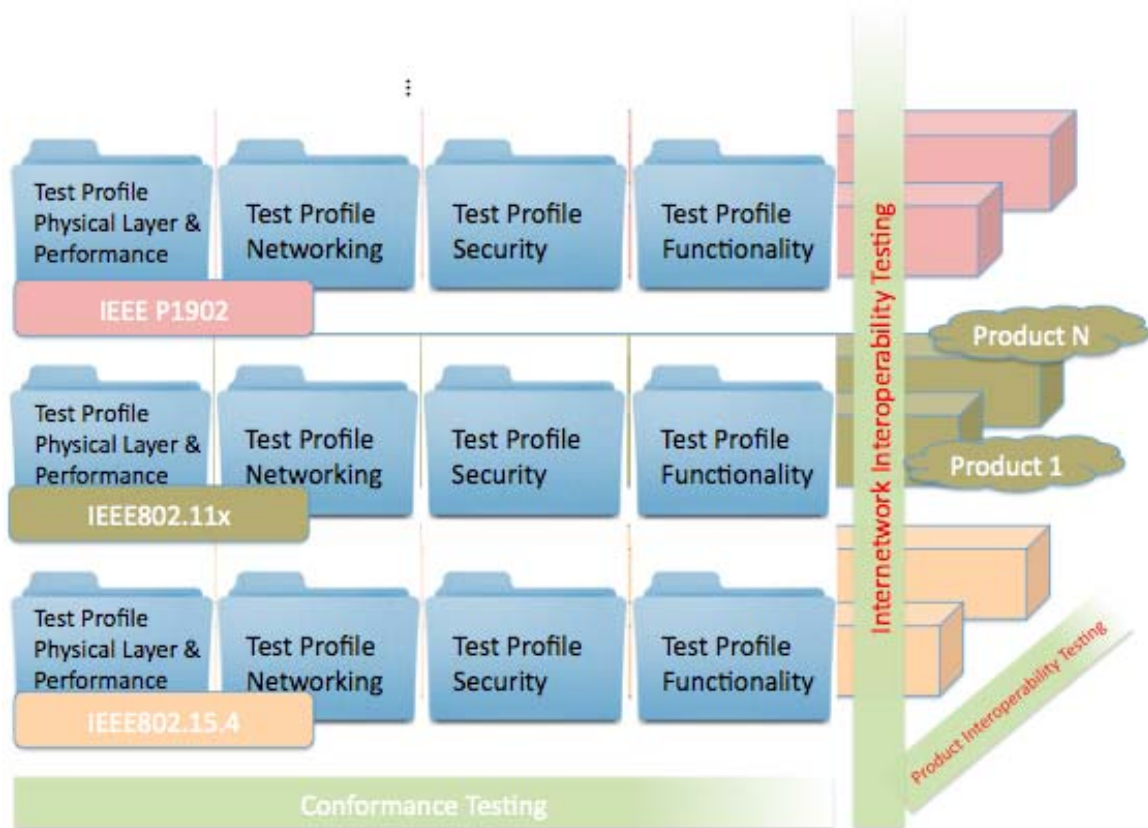

202

203

# Interoperability Process Reference Manual (IPRM)

204 rate from interoperability testing. Nevertheless, conformance and interoperability testing  
205 are interrelated in a matrix relationship.  
206

207  
208 **Figure 4 – Product Conformance And Interoperability Testing Matrix**

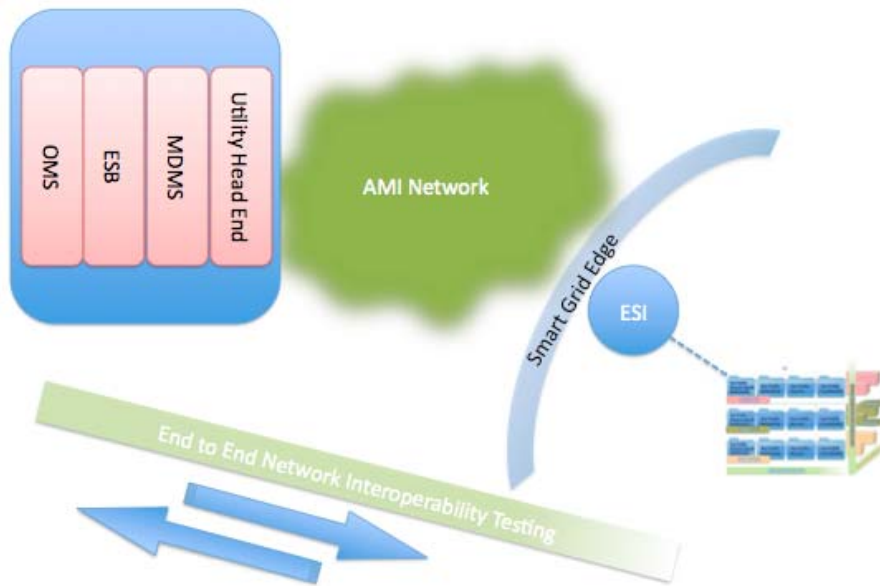

209  
210 As shown in Figure 4, the Y-axis represents internetwork interoperability (i.e. transactions  
211 between different physical layer implementations via routing systems) while the Z-axis  
212 represents inter-product interoperability related to interaction between different instances of  
213 a particular set of physical networks.

214

# Interoperability Process Reference Manual (IPRM)

215 Finally, the end-to-end network interoperability testing example in Figure 5 illustrates the  
216 requirements of a Smart Grid utility when implementing a communications standard from  
217 the meter head-end system to the edge realm.  
218

219  
220 **Figure 5 – End-to-End Network Interoperability Testing<sup>2</sup>**

221  
222 In summary, interoperability testing is not only relevant for product-to-product interoperabil-  
223 ity but also for inter-network and end-to-end network interoperability.

224  
225 Figure 6 shows the relationship between conformance and interoperability testing.

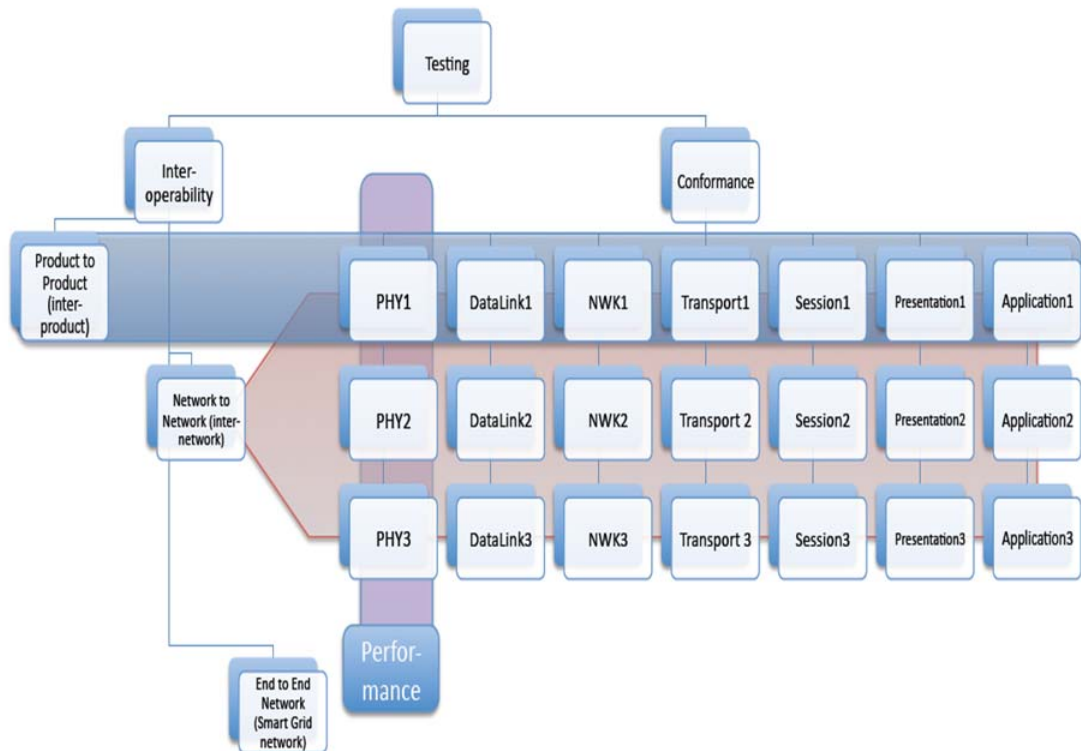

226

---

<sup>2</sup> MDMS stands for Meter Data Management System, ESB stands for Enterprise Service Bus and OMS stands for Outage Management System.

# Interoperability Process Reference Manual (IPRM)

227

228

Figure 6 – Conformance and Interoperability Testing Relationship

229

230

A full coverage of all use cases and resultant test cases, and verification against all instances of products is the only way to ensure full deterministic interoperability. Generally, practical considerations make a full coverage impractical. Hence this document assumes statistical coverage of use cases and test cases, and therefore by default, the product interoperability discussed here is generally statistical in nature.

235

236

## 5.2 Scope of ITCA Categories

237

Communications technologies have typically followed certain methods to verify interoperability, and these methods are reviewed in this section based on their category. Each ITCA

238

# Interoperability Process Reference Manual (IPRM)

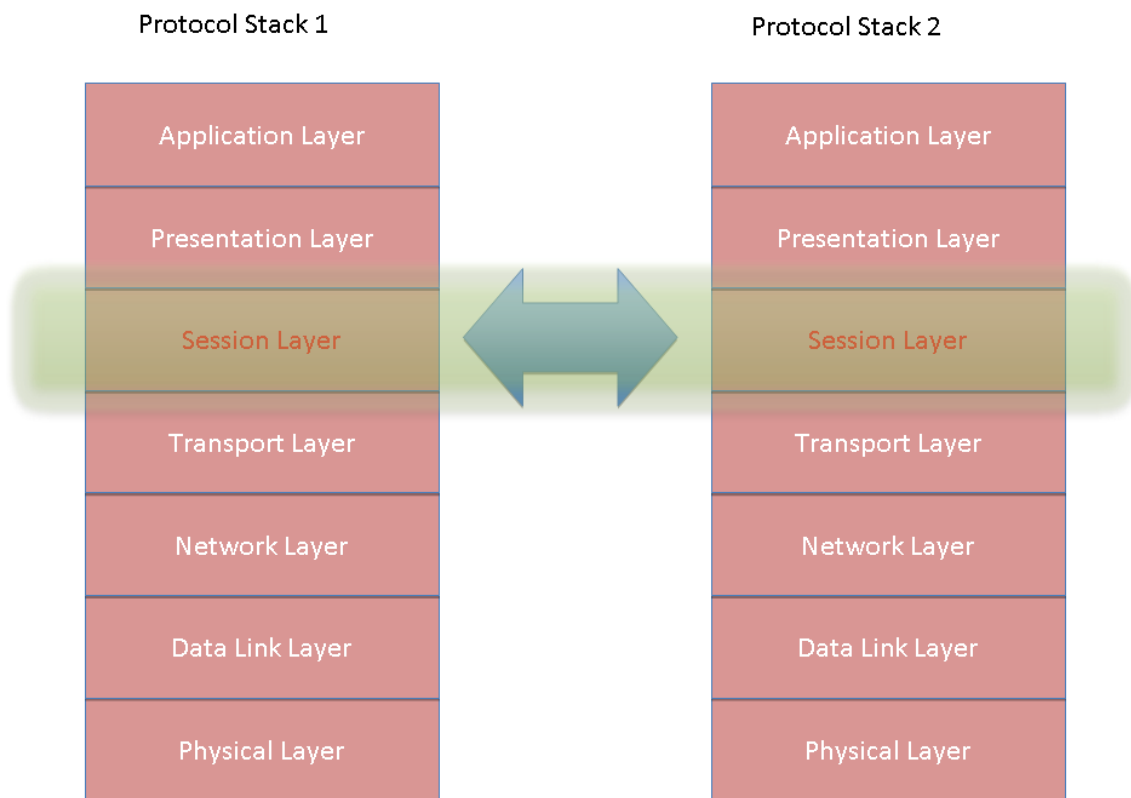

239 category addresses different scopes of communication, networking, or business layers and  
240 logic.

241

## 242 5.2.1 Category I ITCA:

243 Manages testing and certification programs for communication technologies involv-  
244 ing one or more layers from layers 3-7 of the OSI stack. Typically it involves verify-  
245 ing the application level pair-wise communication between two product implemen-  
246 tations of a standard.

247

e.g. SSL/TLS session established by a public key interchange

248

249

Figure 7 – Example of Category I ITCA

250

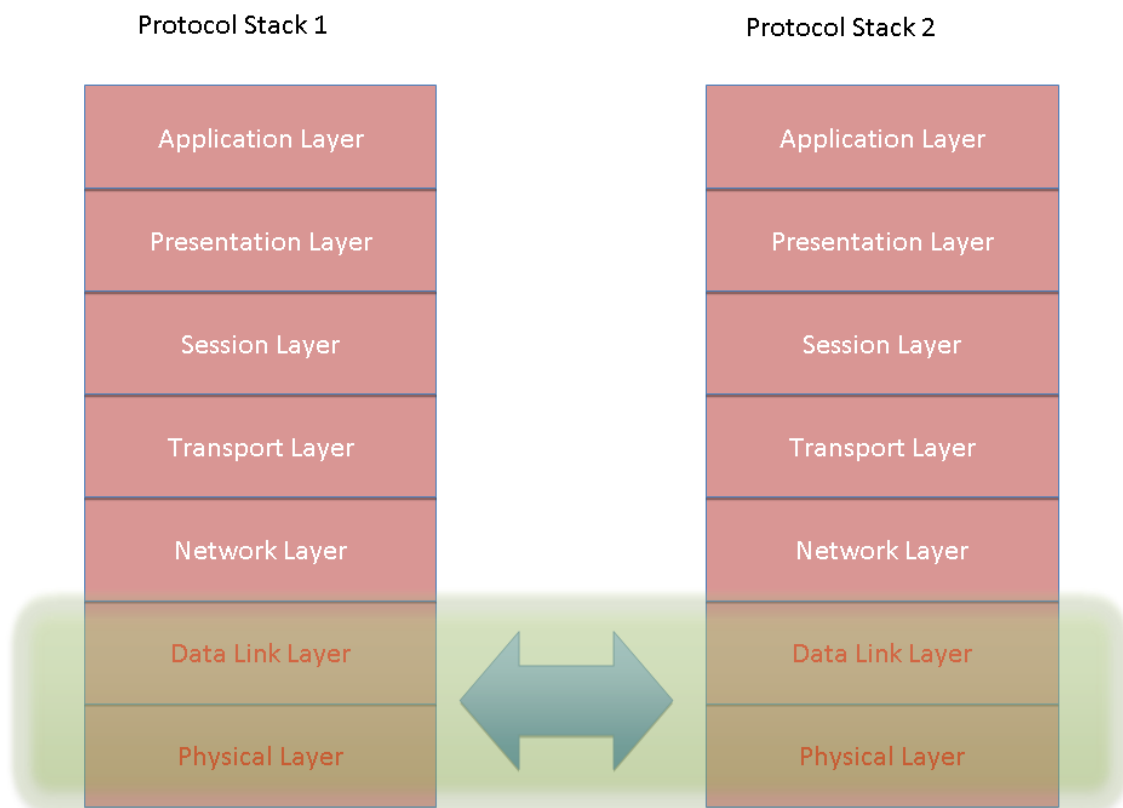

## 5.2.2 Category II ITCA:

# Interoperability Process Reference Manual (IPRM)

251 The Category II ITCA manages testing and certification programs for platform<sup>3</sup> level  
252 communication protocols. This includes Physical and Data Link Layer conform-  
253 mance testing, interoperability testing, and performance testing.

254

e.g. interoperability between two implementations of IEEE 802.15.4 PHY/MAC

255

256

Figure 8 – Example of Category II ITCA

257

### 5.2.3 Category III ITCA:

258

The Category III ITCA manages testing and certification programs for communica-  
259 tion technologies corresponding to Physical and Data Link Layer and one or more  
260 of the higher layers. The Category III ITCA includes Category II ITCA, protocol

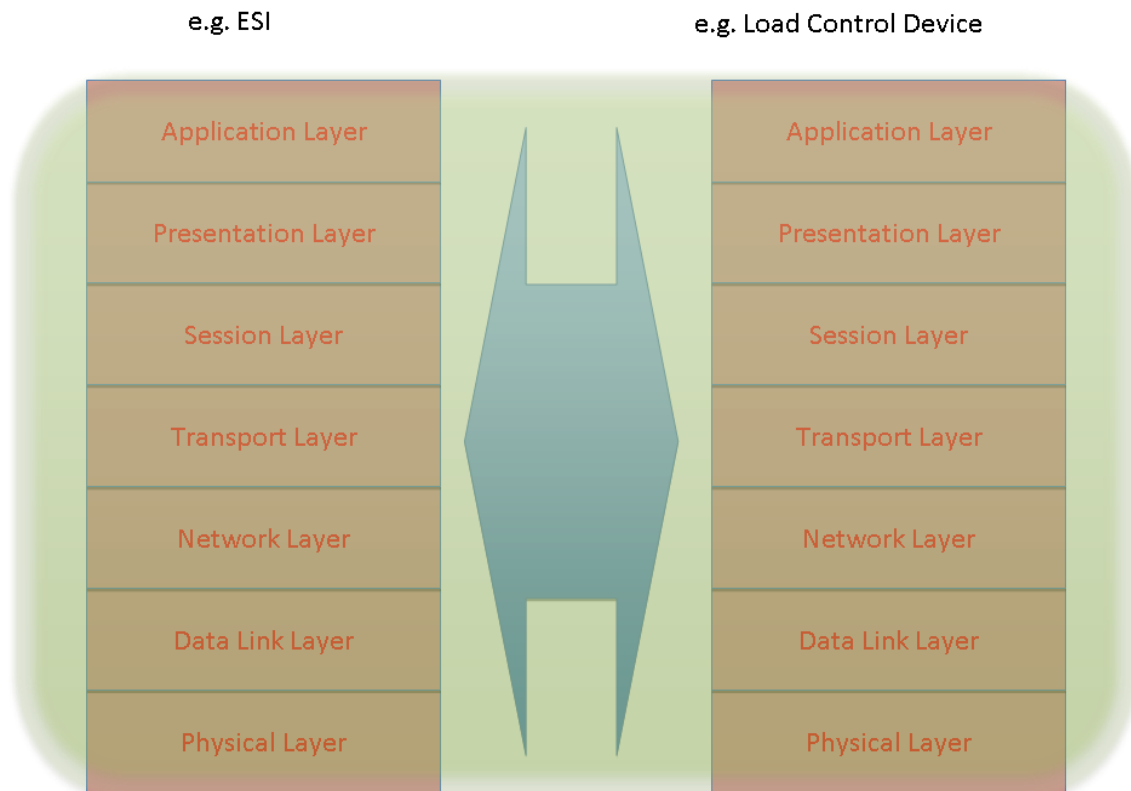

# Interoperability Process Reference Manual (IPRM)

261 conformance testing above PHY / MAC layers and device level or product level in-  
262 teroperability testing. The Category III ITCA may also rely on Category II ITCA cer-  
263 tificates when sufficient inheritance rules are defined and agreed upon.

264

e.g. interoperability between products

265

266

Figure 9 – Example of Category III ITCA

267

268

## 5.2.4 Category IV ITCA:

269

270

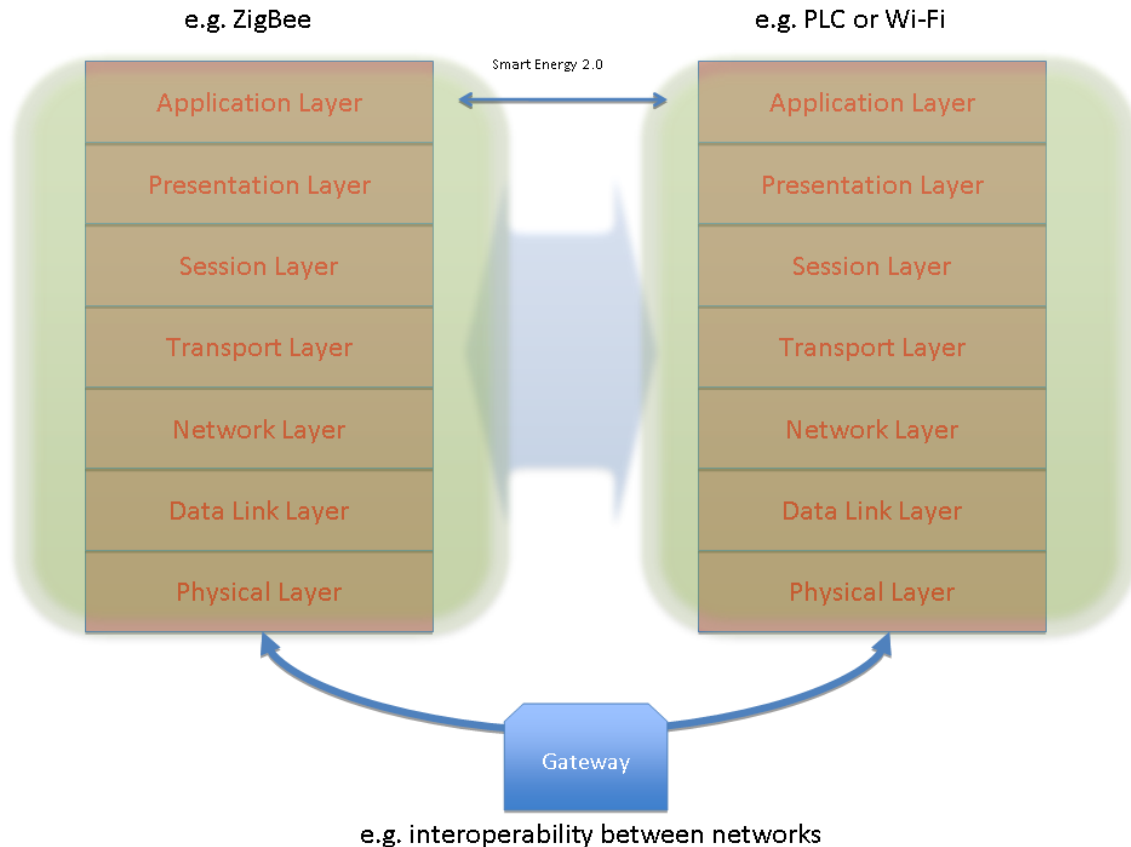

271

The Category IV ITCA manages testing and certification programs for communication technologies based on standards requiring interoperability between dissimilar physical networks. The Category IV ITCA includes Category II ITCA and Category

# Interoperability Process Reference Manual (IPRM)

272 III ITCA certification results, as well as the certification of interoperability for other  
273 relevant layers.  
274

275 e.g. interoperability between networks

276 Figure 10 – Example of Category IV ITCA

## 277 5.2.5 Category V ITCA:

278 The Category V ITCA manages testing and certification programs for communica-  
279 tion inter-networking technologies, and incorporates Category I, II, III or IV ITCA  
280 testing results depending on the standard and system level interoperability required  
281 by a deployment. End-to-End network interoperability testing (e.g. simulating a  
282 back office network) is typically involved as part of the Category V ITCA.

## Interoperability Process Reference Manual (IPRM)

283 Any category standard can require a Category V ITCA if the standard also specifies  
284 behavior associated with communicating with a third party (e.g., utility back office  
285 system). In this case, the Category V ITCA shall specify test cases that capture the  
286 desired behavior (e.g. simulate a utility back-office system).

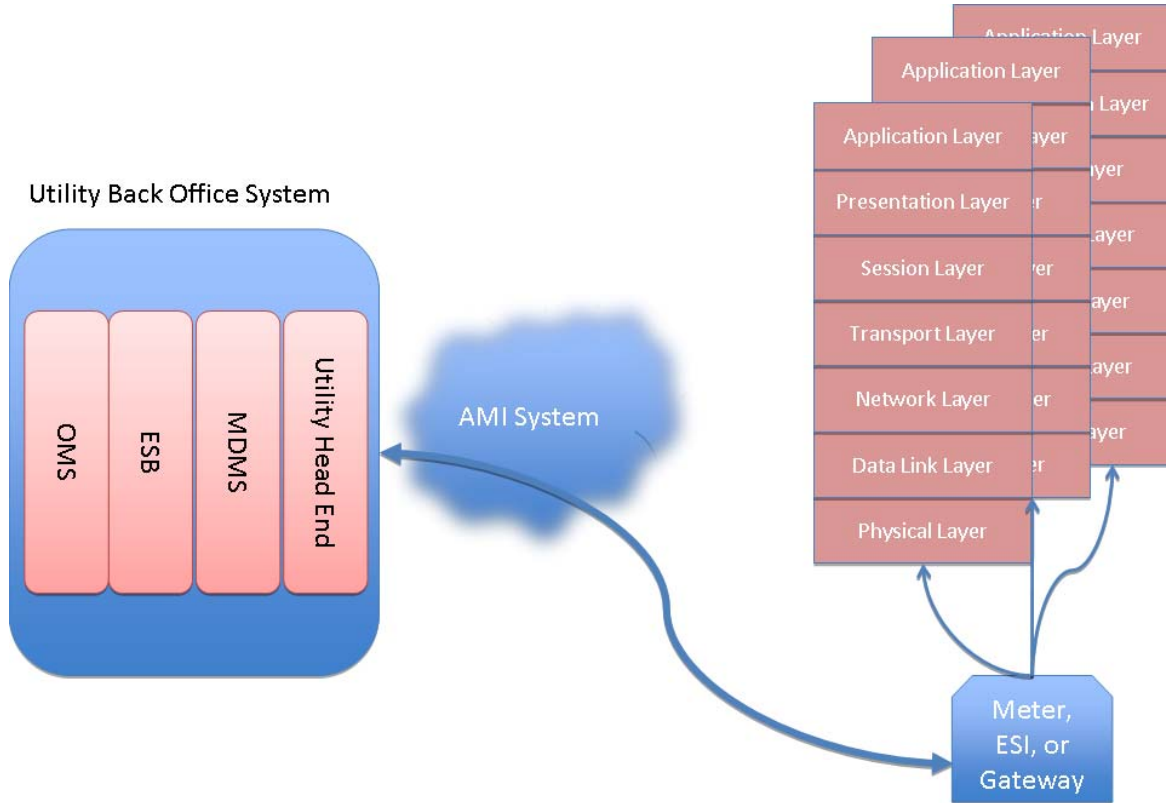

287  
288 Other than the above requirement, a Category V ITCA shall follow the requirements  
289 stated elsewhere in this document depending on the type of standard it specifies  
290 (i.e. Category I, II, III, or IV ITCA). Smart Energy Profile 2.0 is an example of a  
291 Category V ITCA standard since the standard describes registration to a service  
292 provider network.

293

294

# Interoperability Process Reference Manual (IPRM)

e.g. end to end interoperability

Figure 11 – Example of Category V ITCA

295

296

297

298

## 5.2.6 Business Reference Authority:

299

300

301

302

303

304

Depending on the standard, there might be a need for an additional layer of authority testing to enforce additional specific requirements for a standards-based technology. This document recognizes the importance of such entities, but does not specify requirements for such entities since their scope varies greatly based on the business requirements.

As an example, the development and integration of the Smart Meter Texas portal to

## Interoperability Process Reference Manual (IPRM)

305 support energy management programs using Smart Energy Profile 1.0 was based  
306 on business processes defined within the State of Texas. The business processes  
307 further defines the operational aspects of the integrated solution which ultimately  
308 affects the product interoperability test cases.

# Interoperability Process Reference Manual (IPRM)

## 309 6.0 Product Testing

310

### 311 6.1 Testing Scope and Administration

312 Testing for conformance and interoperability requires considerations for the overall test  
313 coverage as illustrated in Figure 12. A test suite generally represents a set of test cases in  
314 each of the categories (e.g., network test suite) represented in the diagram. A test profile  
315 can be defined for an element of that category, along with various test suites and test re-  
316 sources<sup>3</sup> such as test harnesses. A test campaign can represent a test profile implementa-  
317 tion or specific test suites; in either case, the campaign defines the scope of testing and  
318 the administration related to management of the process.

319

320 ITCA is expected to dependably manage a testing program. The details of the actual  
321 process control are described as part of the Testing Program outlined in section 6.2.

322

323 For each test suite, basic administrative controls are required and formalized using testing  
324 resources such as PICS, test case reference lists, version control, test laboratories, and  
325 validated test harnesses. The record of administrative control is outlined in the test plan,  
326 test report and product compliance folder<sup>3</sup>.

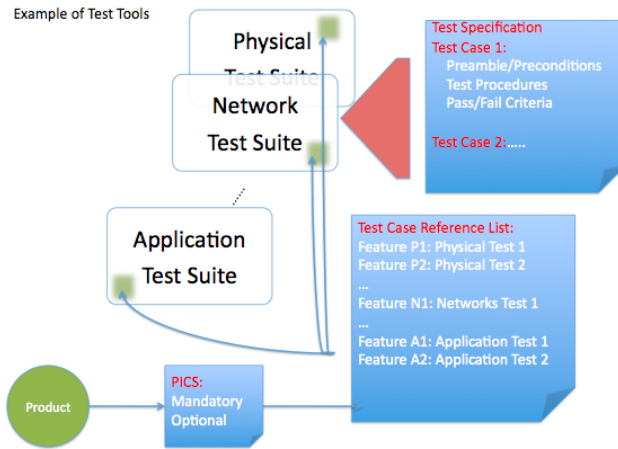

327

---

<sup>3</sup> See Glossary of Terms.

# Interoperability Process Reference Manual (IPRM)

328

329

330

Figure 12 – Product Test Planning

331

332

333

Figure 12 also illustrates a process in which the product, with its mandatory and optional features per declared PICS, is processed for test planning using the Test Case Reference List and a subsequent test implemented according to the test specifications.

# Interoperability Process Reference Manual (IPRM)

## 334 7.0 Testing Program

### 335 7.1 Testing Process Management

336 Testing processes are often developed separately from the product development process.  
337 This provides for a level of technical independence that makes good testing rigorous and  
338 objective. At the same time, it creates a conflict with certain realities of product develop-  
339 ment, both in the hardware and software realm. Figure 13 depicts a typical product life cy-  
340 cle process which is used in delivering a product to market. Previous sections in this  
341 document provide a context in which these processes are applied in a particular test cam-  
342 paign.

343

344

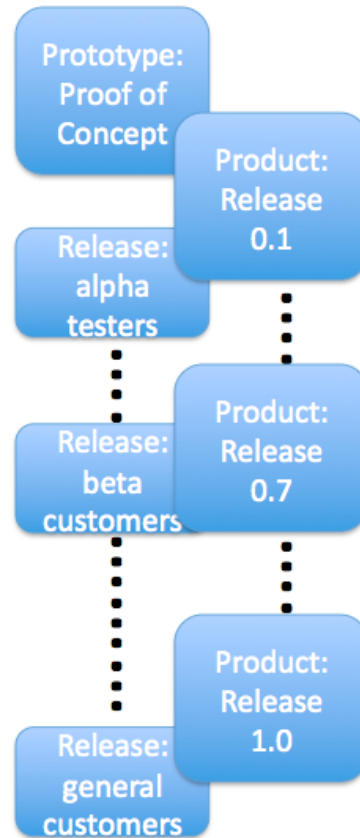

# Interoperability Process Reference Manual (IPRM)

Product Life Cycle- Device

Product Life Cycle- Software (Agile)

345  
346  
347  
348  
349  
350  
351  
352  
353  
354  
355  
356

Figure 13 – Product Life Cycle

Product certification through testing ostensibly needs to happen at the end of the process depicted in the diagram. With respect to hardware, product certification lies somewhere between the production pilot and mass production processes. As for software, product certification is performed before the general release of the software (i.e. version 1.0) to customers. However, economic reality dictates that changes resulting from test evidence should happen as early in the process as possible. This requires that during each and every step of the product development process, it is in the best interest of both the manufacturers and the ITCA to provide frequent certification program-related testing resources<sup>3</sup> throughout the process. Frequent testing reduces the total cost of the product and in-

# Interoperability Process Reference Manual (IPRM)

357 creases market acceptance, since problems are detected early and folded into the design  
358 of the product.

359

360 To address the need for frequent testing, third-party test laboratories are used for pre-  
361 testing. ITCA-sponsored testing events are organized to facilitate the introduction of a fully  
362 conforming and interoperable product into the market

363

364

365 **Figure 14 – Transition From Pre-Testing / Engineering Testing To Certification Testing**

366

367 The transition from ITCA-sponsored pre-testing / engineering testing to certification testing,  
368 as noted in Figure 14, may not always be as clear-cut when the service is rendered by an  
369 ITCA-validated third-party test laboratory. Rigor is injected into the process by third-party  
370 laboratories by their having a test service management system adhering to ISO Guide  
371 17025.

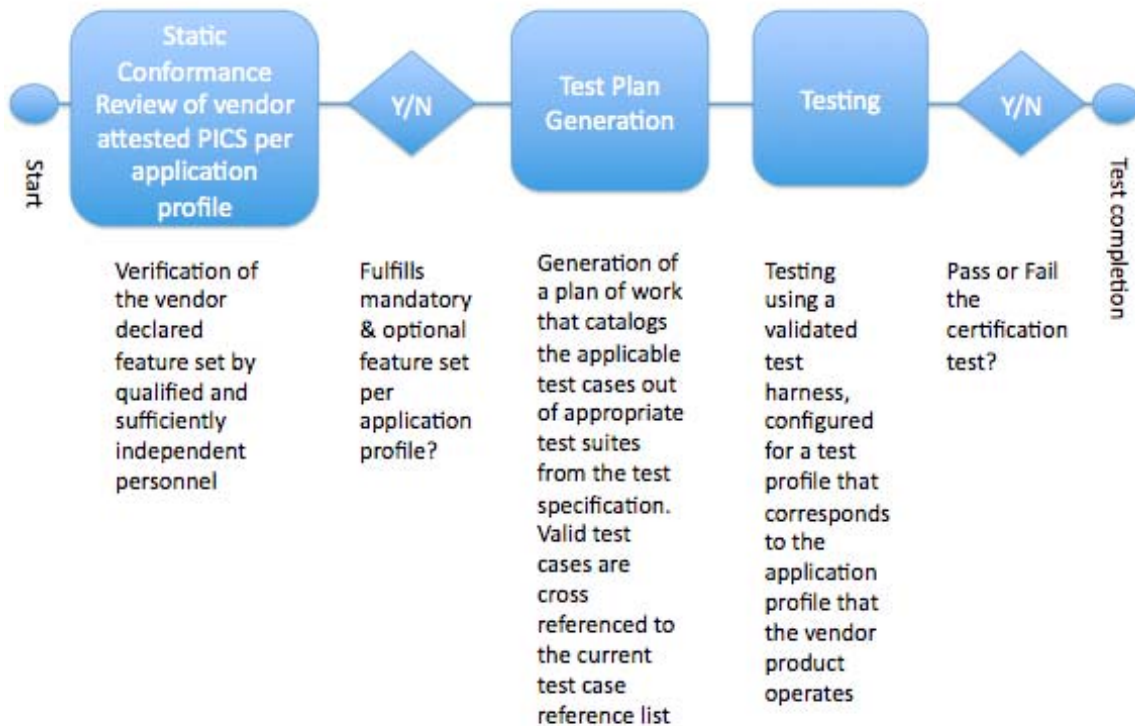

372

## 7.2 Certification Testing for Conformance and Interoperability

# Interoperability Process Reference Manual (IPRM)

373 Once testing moves to the Conformance and Interoperability Certification Testing phase  
 374 with the test laboratories, the following steps are generally expected. Note that this may  
 375 happen at any point in the product development process, and that when it is prior to the  
 376 end of the development cycle, it is the responsibility of the vendor together with the test  
 377 laboratory, per their test service management system, to fulfill the canonical steps de-  
 378 scribed in Figures 15 and 16 for certification related testing.  
 379

380  
 381 Figure 15 - Conformance and Interoperability Certification Testing – Part 1  
 382

# Interoperability Process Reference Manual (IPRM)

Figure 16 – Conformance and Interoperability Certification Testing – Part 2

The process denoted in Figures 15 and 16 is implemented by a test laboratory for certification testing of conformance and interoperability. The roles and responsibility of individual experts may differ with each ITCA. One key point to recognize is the independence of the product vendor, tester, qualifier, and certifier processes.

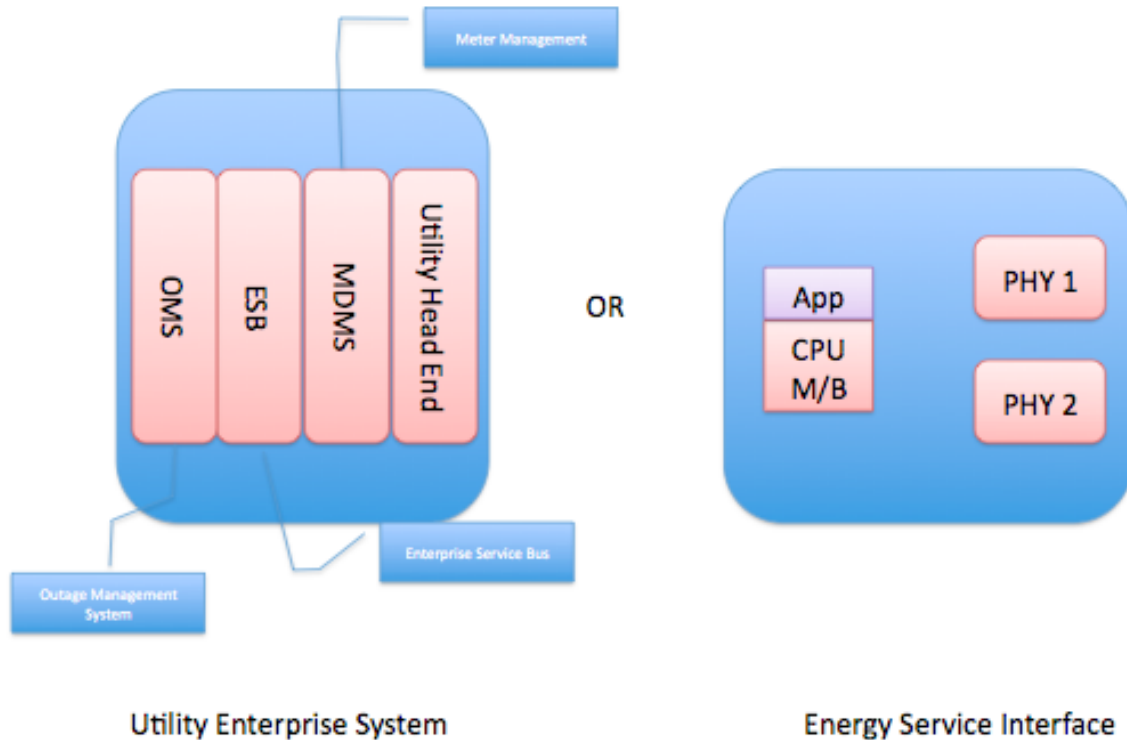

### 7.3 Products and Product Systems

The testing and certification process will be applied to products being implemented as Smart Grid technology. In certain instances, products are composed of components which are used to build a total product system. In such cases, components or "subsystems" may be subject to separate and inheritable certification processes by the ITCA.

# Interoperability Process Reference Manual (IPRM)

## Examples of System and Subsystem / Components

Utility Enterprise System

Energy Service Interface

Figure 17 – Examples of System and Subsystem / Components

396  
397  
398  
399  
400  
401  
402  
403  
404  
405  
406  
407  
408

In figure 17, a large enterprise utility software system and an edge in-premise energy service interface device are given as examples of a system and subsystem / components. Any one of the components of the respective integrated product may be subjected to testing under the ITCA requirements, and its results may or may not be inheritable by the integrated system. The successful inheritance by an integrated system depends on the test coverage and the version of the testing applied to the subsystem, and the version of the subsystem itself.

The record of work of the subsystem component, or the system test, is stored in the compliance folder of the product. The compliance folder will include the detail of the Compliant

# Interoperability Process Reference Manual (IPRM)

409 Portion Description (CPD)<sup>4</sup> of the subsystem, if it is to be inheriting the certified test status  
410 of that subsystem and integrating it into the whole system. In such a case, the system cer-  
411 tification is additive of the CPDs of constituent components, but may still need additional  
412 tests based on test coverage as defined by relevant applicable test for the application pro-  
413 file for the product in question, and as defined by the test plan derived from the PICS, Test  
414 Case Reference List, and Test Specification.

---

<sup>4</sup> See Glossary of Terms for definition and explanation of CPD

# Interoperability Process Reference Manual (IPRM)

## 415 8.0 Interoperability Testing And Certification Authority Role And 416 Requirements

417 The ITCA shall provide governance and coordination for the maintenance and administration of  
418 Interoperability Testing Laboratories and Certification Bodies in cooperation with the relevant SSOs  
419 and user groups. An ITCA shall manage the end-to-end processes associated with interoperability  
420 testing and certification. It is assumed that the ITCA has the appropriate infrastructure in place to  
421 support this function. Although beyond the scope of the IPRM, if a new ITCA is being launched,  
422 establishment of the following is recommended:

- 423 • Business plan
- 424 • Clear governance structure and IPR policy
- 425 • Testing lab(s)
- 426 • Certification body / bodies
- 427 • Security certificate authority
- 428 • Technical Lead(s)

429 The following information shall be used as a guide by the ITCA to improve the interoperability and  
430 quality of a Smart Grid standards based product.

### 431 8.1 Interoperability Requirements For Use By The ITCA

432 The interoperability requirements are comprised of five major categories which will be used  
433 by the ITCA to effectively manage the testing and certification organization processes. The  
434 five major categories are:

- 435 • Governance
- 436 • Lab Qualification
- 437 • Technical Design
- 438 • Improvement
- 439 • Security

440

# Interoperability Process Reference Manual (IPRM)

441 The IPRM requirements are written with the key word “shall”. However, depending on the  
442 standard under consideration, only a subset of those requirements are relevant. The fol-  
443 lowing conventions are being used for classification:

- 444 • Basic (B) – Minimum requirement. The requirements shall be considered manda-  
445 tory and included to ensure interoperability.
- 446 • Optional (O) – Requirement identified as a use case for the business application,  
447 but shall not be considered mandatory as part of the interoperability testing.
- 448 • Not Applicable (N/A) – Requirement identified as a use case for the business ap-  
449 plication, but does not apply to the specified standard under consideration.

450 As mentioned in section 5.2.5 above Category V ITCAs are required to adhere to the re-  
451 quirements of Category I, II, III and IV ITCAs depending on the standard under considera-  
452 tion. However, in addition they shall satisfy requirements Tech 36 and Tech 37 below.

453

## 454 8.2 Governance

455 Governance defines the structures, policies, rules and regulations associated with the  
456 ITCA certification program. A governance process example would require the ITCA to es-  
457 tablish and maintain an independent and vendor neutral testing and certification oversight  
458 authority. The following list of Interoperability Governance Process Requirements provided  
459 in Table 1 shall be considered governance process requirements for managing the interoper-  
460 ability testing and certification programs.

461

462

Govern-x	Interoperability Governance Process	ITCA Category			
	Requirement Description	I	II	III	IV
Gov-1	An interoperable standard shall have an entity identified as the ITCA. This entity shall be responsible for	B	B	B	B

# Interoperability Process Reference Manual (IPRM)

	ensuring that implementations are in fact interoperable. <sup>5</sup>				
Gov-2	An ITCA shall be considered valid as long as its users' community considers it valid, and when there exists three or more distinct implementations of the specification for which the three distinct implementations are from three different entities. These three or more distinct implementations must be available or declared available. Note: If the three distinct entities declare intent to implement the specification, this requirement is satisfied.	B	B	B	B
Gov-3	The ITCA certifying the highest layer of technology under test shall not declare an implementation as interoperable if it discovers interoperability problems at a lower layer (e.g. the ITCA responsible for application layer testing returns the product to lower layer ITCAs for further investigation of non-interoperable features).	B	N / A	B	B
Gov-4	The ITCA shall clearly define the circumstances in which it supports first party testing.	B	B	B	B
Gov-5	The ITCA shall clearly identify the circumstances in which third-party testing is required.	B	B	B	B
Gov-6	The ITCA shall define a corrective process for resolving reported interoperability problems (e.g. in the field	B	B	B	B

<sup>5</sup> Situations where a clear ITCA does not exist are out of scope of this document. The SGTCC will tackle issues where clear ITCAs do not exist in a separate effort.

## Interoperability Process Reference Manual (IPRM)

	or as part of the test) for products for which they are responsible. <sup>6</sup> Further, it shall implement preventative processes to avoid recurrence of such problems. A problem may be associated with the specification, the test processes and procedures or the test data.				
Gov-7	The ITCA shall define roles, responsibilities, and resource elements of the interoperability program in a concise document.	B	B	B	B
Gov-8	The ITCA shall support a mechanism to raise issues up to steering bodies and liaison organizations for business, regulatory and standards interoperability considerations.	B	B	B	B
Gov-9	The ITCA shall maintain a certified product and systems list. This list shall be publicly available.	B	B	B	B
Gov-10	The ITCA shall maintain a test case reference and modification history list. <sup>7</sup>	B	B	B	B
Gov-11	Test Suite Specifications (TSS) <sup>8</sup> used for interoperability or conformance testing shall be managed in a well-defined, open and formal manner with change control.	B	B	B	B
Gov-12	A common TSS shall be established when multiple test labs are deployed to test the same standard and / or profile. If common unique test procedures are required to support this test suite, then they shall also	B	B	B	B

<sup>6</sup> The ITCA should use best efforts in contacting a standards body with respect to a specification; however, it not their responsibility to resolve issues with the specification.

<sup>7</sup> See Glossary of Terms for definition and explanation of the test case reference list.

<sup>8</sup> See Glossary of Terms for definition and explanation of the TSS.

# Interoperability Process Reference Manual (IPRM)

	be defined. The TSS should be test tool agnostic.				
Gov-13	All certification bodies and ITCAs acting as certification bodies shall adhere to ISO / IEC Guide 65 principles, and requires auditing by outside third-parties. <sup>9</sup>	B	B	B	B
Gov-14	The ITCA shall minimize divergence of interoperability requirements interpretations. <sup>10</sup>	B	B	B	B
Gov-15	If an ITCA has multiple testing laboratories and certifying bodies, processes shall be in place to avoid quality differences and assure repeatable testing between the laboratories.	B	B	B	B
Gov-16	The ITCA shall periodically re-examine their internal processes, best practices and tools based on corresponding specifications, and obtain a qualified third-party review per ISO guide 65.	B	B	B	B
Gov-17	The ITCA shall ensure that the test labs and certification bodies maintain their accreditation for the specific standard under consideration. If a standard is not yet available for listing by an accreditation body, it shall be assured that the test facility overall maintains an accreditation and is being reviewed by the ITCA as technically able to test the standard.	B	B	B	B

463

**Table 1 – Interoperability Process Governance Requirements**

<sup>9</sup> Some interpretations of ISO Guide 65 consider certification body membership requirements as non-conforming to the intent of ISO Guide 65 Section 4.1. The SGTCC recognizes that many of the certification authorities supporting Smart Grid standards are member based organizations providing useful services. It is the view of the SGTCC that membership based programs are acceptable in meeting the intent of its criteria and recommendations. As long as membership requirements are offered to any interested participants in a fair and unbiased process, meeting the other non-discriminatory criteria of ISO 65, this form of certification authority is acceptable to the SGTCC.

<sup>10</sup> One way to minimize divergence of interpretations is to limit the number of labs to only one. Another option for minimizing divergence are to have a technical lead (also known as a lead lab) responsible for properly interpreting conformance and interoperability issues.

466  
467  
468

## 8.3 Lab Qualification

Lab qualification defines the requirements in Table 2 that shall be applied by ITCAs when recognizing testing laboratories. It should be noted that additional requirements are further detailed in ISO 17025.

Lab-x	Interoperability Lab Qualification Process Requirement Description	ITCA Category			
		I	II	III	IV
Lab-1	In selecting test organizations, the ITCA shall have uniform and transparent procedures for evaluating test labs.	B	B	B	B
Lab-2	The ITCA shall define requirements to qualify the personnel involved in the certification and testing processes per ISO 17025.	B	B	B	B
Lab-3	The ITCA shall require that its test labs adhere to ISO 17025.	B	B	B	B
Lab-4	Where applicable, the ITCA shall use existing laboratory qualification standards and schemes for evaluating test labs.	B	B	B	B

469

Table 2 – Interoperability Lab Qualification Process Requirements

## 8.4 Technical Design for Interoperability and Conformance Program Design

The Technical Design for Interoperability and Conformance Program Design defines the requirements needed to effectively manage the procedures and processes associated with interoperability and conformance testing.

# Interoperability Process Reference Manual (IPRM)

477

Tech-x	Interoperability Technical Design Process		ITCA Category			
	Category	Requirements Description	I	II	III	IV
Tech-1	Technical	The ITCA shall specify in the test program requirements those features that are mandatory, and those features that are optional.	B	B	B	B
Tech-2	Technical	The ITCA shall require and enforce that vendors declare the optional features implemented in a product.	B	B	B	B
Tech-3	Technical	If more than one vendor implements the same optional feature in a product, the ITCA shall require that future implementations of that optional feature be tested and certified for conformance and interoperability. Furthermore, the ITCA shall define common test cases for that optional feature to be used by all test labs when testing for that optional feature.	B	B	B	B
Tech-4	Technical	Where market clarity is required, separate certificates <sup>11</sup> shall be associated with products implementing optional requirements.	B	B	B	B
Tech-5	Technical	An ITCA shall have procedures and processes in place to retain a record of work of the testing and certification process to	B	B	B	B

<sup>11</sup> See Glossary of Terms for definition of certificate.

# Interoperability Process Reference Manual (IPRM)

		be called a Compliance Folder or record of work. For example, a compliance folder per certified product could include test reports, revision control documents, description of the implementation, etc.				
Tech-6	Inheritance	The ITCA shall allow for sub-component (e.g., previously certified hardware modules used in developing final products, previously certified software components with well defined interfaces and dependencies etc.) inheritance in development of final products. However, it is the ITCAs responsibility to ensure that interoperability is maintained.	B	B	B	B
Tech-7	Inheritance	The ITCA shall maintain a controlled list of compatible sub-components that can be inherited to build final products. This might include specifying compatible feature-sets.	B	B	B	B
Tech-8	Inheritance	When supporting products composed of sub-components, the ITCA shall define the set of additional tests necessary to ensure interoperability (e.g. integration testing, final performance testing, etc.)	B	B	B	B
Tech-9	Inheritance	The ITCA shall implement a Compliant Portion Description (CPD) <sup>12</sup> to be used	B	B	B	B

<sup>12</sup> See Glossary of Terms for definition and further explanation of CPD

## Interoperability Process Reference Manual (IPRM)

		as a guide for assembling a product based on compatible sub-components.				
Tech-10	Version Control	The ITCA shall have an explicit process in place to assess necessity of re-certification against subsequent release versions of a specification, including security.	B	B	B	B
Tech-11	Version Control	The ITCA shall define the level of re-certification required for subsequent release versions of a specification.	B	B	B	B
Tech-14	Version Control	The ITCA shall define a mechanism to identify the latest version of a previously certified product or system implementation. This is important in cases where a previously certified product or system has been upgraded to a different version.	B	B	B	B
Tech-15	Version Control	The ITCA shall have a mechanism to enforce version control rules to ensure compliance (e.g. standards usually have to go back to the accreditation body if they are changing the version).	B	B	B	B
Tech-16	Testing - General	The testing and certification program shall have common well-defined standardized test cases. These test cases should be defined in an open, consensus-driven fashion, following ANSI-type processes. These test cases will be used by	B	B	B	B

# Interoperability Process Reference Manual (IPRM)

		all test labs approved by the ITCA.				
Tech-17	Testing – General	There shall be a defined correlation between implementations and required testing, commonly called a Proforma Implementation Conformance Statement (PICS). <sup>13</sup>	B	B	B	B
Tech-18	Testing - General	The testing and certification program shall maintain a current and upcoming list of applicable test cases to be called a Test Case Reference List.	B	B	B	B
Tech-19	Testing – General	There shall be a Test Plan derived from the Test Case Reference List and used by all authorized test labs. Tests shall be identified using the test plan.	B	B	B	B
Tech-20	Testing – General	The testing and certification program shall require that a static conformance review <sup>14</sup> take place prior to testing a product.	B	B	B	B
Tech-21	Testing – General	The testing and certification program shall first validate the tests, and implement them utilizing validated test tools. Golden reference test equipment may be utilized where appropriate.	B	B	B	B
Tech-22	Testing –	The TSS shall be subject to revision con-	B	B	B	B

<sup>13</sup> PICS can be referred as both Protocol Implementation Conformance Statement and Profile Implementation Conformance Statement. Proforma is being used in this requirement to reference both concepts.

<sup>14</sup> See Glossary of Terms for the definition and explanation of a static conformance review.

# Interoperability Process Reference Manual (IPRM)

	General	<p>control, including revision history, revision numbering, and a defect and expansion management process. The TSS should clearly identify the test purpose, references, resource requirements, test setup, procedures, observable results and possible problems / lessons learned with the test approach. Observables should clearly identify pass / fail / indeterminate requirements and informational elements.</p>				
Tech-23	Testing - Conformance	<p>The testing and certification program shall assure that defined product test cases cover application profiles for specific feature sets and functions defined by the specific application profile, and implement interoperability evaluation within that application profile.</p>	B	B	B	B
Tech-24	Testing – Conformance	<p>Where practicable, the testing and certification program shall assure that defined product test cases cover all feature sets and functions.</p>	B	B	B	B
Tech-25	Testing – Conformance	<p>The testing and certification program shall define and evaluate based on concise pass / fail criteria, yet allowing for inconclusive outcomes. Note: An inconclusive test run cannot result in certified products. Inconclusive test results</p>	B	B	B	B

## Interoperability Process Reference Manual (IPRM)

		shall be investigated to clearly identify what is required to move out of the inconclusive state.				
Tech-26	Testing – Conformance	The testing and certification program shall define conformance testing per OSI 7-layer, and end-to-end testing from the physical to the application layer as relevant and necessary.	B	B	B	B
Tech-27	Testing – Product Interoperability	The testing and certification program shall assure that defined product use cases are covered in application profiles. Interoperability testing and evaluation shall be implemented within those application profiles.	B <sup>15</sup>	N / A	B	B <sup>16</sup>
Tech-28	Testing – Product Interoperability	The testing and certification program shall classify common or major market products according to their application profiles, and include them as part of an interoperability evaluation for those specific profiles. The evaluation shall make use of test profiles correlated to those specific applications. <sup>17</sup>	B <sup>18</sup>	B	B	B <sup>18</sup>
Tech-29	Testing –	The testing and certification program	O	B	B	B

<sup>15</sup> Only basic for category I ITCAs that tackle the application layer.

<sup>16</sup> Can be N/A for category IV ITCAs that correlate to Category II standards.

<sup>17</sup> Interoperability testing is tied to market realities. Hence the testing and certification program needs to have a mechanism to adopt representative market products as an integral part of interoperability testing.

<sup>18</sup> Only a basic requirement for those ITCAs that correlated with application layer standards.

## Interoperability Process Reference Manual (IPRM)

	Product Interoperability	shall ensure that venues are provided for multi-vendor and multi-product communication and interchange evaluations (i.e. “plug fests”). This program may be optional for ITCAs correlated to standards resulting in application interfaces and not a physical product (e.g. OpenADE)”.				19
Tech-30		Prototyping of draft standards or major revisions shall be supported via multi-vendor / multi-product testing. The ITCA shall solicit for the prototyping of draft standards or major revisions, and organize multi-vendor / multi-product testing. It is recommended that the prototyping take place in the late stages of standards development in order to verify the correctness of the standard, verify the test suites and verify that the anticipated interoperability or conformance testing is debugged.	O	B	B	B <sup>19</sup>
Tech-31	Testing – Product Interoperability	The ITCA shall have a process to select a minimum of two distinct reference implementations as golden implementations or golden units. The selection is usually based on the results of the interoperability testing. All other implementations	O	B	B	B <sup>19</sup>

---

<sup>19</sup> Can be optional for Category IV ITCAs that correlate to Category I standards.

## Interoperability Process Reference Manual (IPRM)

		shall be tested against these golden implementations. <sup>20</sup>				
Tech-32	Testing – Product Interoperability	The ITCA shall make appropriate provisions for the use of golden implementations in the testing and certification program to strengthen consistent and standard implementation and interoperability testing and certification processes.	O	B	B	B <sup>1</sup> <sub>9</sub>
Tech-33	Testing – Product Interoperability	The golden implementations or golden units shall be clearly associated with each version of the standard. Each golden unit is a snap shot (instantiation) of each version of the standard.	O	B	B	B <sup>1</sup> <sub>9</sub>
Tech-34	Testing – Product Interoperability	The testing and certification program shall ensure that critical vendor implementations be made available to the labs as golden implementations.	O	B	B	B <sup>1</sup> <sub>9</sub>
Tech-35	Testing – Product Interoperability	The testing and certification program shall define interoperability testing per OSI – 7 layer or per collection of layers, and end-to-end testing from the physical to the application layer as relevant and necessary.	O	B	B	B <sup>1</sup> <sub>9</sub>
Tech-36	Testing –	If a Smart Grid standard impacts and / or	B	B	B	B

<sup>20</sup> The industry prefers three golden units for product testing, but the minimum number of golden units shall be no less than two golden units.

# Interoperability Process Reference Manual (IPRM)

	System Interoperability	crosses multiple Smart Grid systems, then the responsible ITCA <sup>21</sup> shall ensure that venues are provided that support end-to-end testing of Smart Grid systems involving multiple vendors.				
Tech-37	Testing – System Interoperability	A category V ITCA shall involve all relevant parties to define various business logic models for the end-to-end system testing, and make scenarios and test harness systems available for testing.	N / A <sup>2</sup>	N / A <sup>22</sup>	N / A <sup>22</sup>	N / A <sup>22</sup>
Tech-38	Testing - Performance	The testing and certification program shall ensure that when functional performance requirements are defined in an application profile, the performance test profile(s) shall be designed to implement test cases for evaluating these requirements.	B <sup>18</sup>	N / A	B <sup>18</sup>	B <sup>18</sup>
Tech-39	Testing – Performance	The testing and certification program shall define test performance per OSI – 7 layer, and end-to-end testing from the physical to the application layers as relevant and necessary. <sup>23</sup>	B	B	B	B
Tech-40	Tools	The ITCA shall validate test cases, introduce standardized test tools and refer-	B	B	B	B

<sup>21</sup> This is a category V ITCA as described in section 5.2.5. This can remain a Basic requirement for all ITCAs since it is a conditional statement.

<sup>22</sup> This is only N/A for Category I, II, III, IV ITCAs who are not also category V ITCAs.

<sup>23</sup> This is a different requirement than requirement Tech-26 and Tech-35. Tech-26 specifies conformance testing, tech-35 specifies interoperability testing, and this requirement specifies performance testing requirements.

# Interoperability Process Reference Manual (IPRM)

		ence implementations as validated tool sets where appropriate.				
Tech-41	Tools	The ITCA shall ensure that test tools have a complete mandatory feature-set coverage of a standard. In cases where two or more implementations of optional features are available, the ITCA shall incorporate those feature-sets in the test tool. <sup>24</sup>	B	B	B	B
Tech-42	Tools	The ITCA shall define procedures and processes to validate the use of test tools and reference implementations.	B	B	B	B
Tech-43	Technical Lead	The ITCA shall identify an entity (e.g. lab, person, committee etc.) as the technical lead. This technical lead is the responsible authority for ITCA's technical conformance and interoperability matters. Note: The ITCA is the administrative organization, whereas the technical lead has the technical expertise to resolve technical testing and certification issues.	B	B	B	B
Tech-44	Technical Lead	A technical lead(s) shall be responsible for verification of new test cases, valida-	B	B	B	B

<sup>24</sup> Effective test tools need to be able to test all features and functions of a standard. Some features of a standard may never be supported by certain products; however when a standard is published, the industry is free to implement optional feature set in addition to the mandatory set; lack of testing capability of optional feature sets hinders interoperable feature set introduction. Normally, validated test tools have implementations of all features, including optional ones as a condition for the tool validation.

# Interoperability Process Reference Manual (IPRM)

		tion of test tools, resolution of interoperability problems, and other issues of technical discrepancies where the testing laboratories and certification bodies require guidance.				
Tech-45	Technical Lead	A technical lead shall not commercially compete with testing laboratories and certification bodies	B	B	B	B
Tech-46	Technical Lead	The ITCA and the technical lead shall remain neutral to testing laboratories and certification bodies.	B	B	B	B

**Table 3 – Interoperability Technical Design Process Requirements**

478

479

480

## 8.5 Improvements

481

The Improvements section outlines the controls that will need to be in place to support the interoperability testing processes.

482

483

Improv-x	Interoperability Improvements Process Requirements Description	ITCA Category			
		I	II	III	IV
Improv-1	The ITCA shall implement monitoring and auditing programs to ensure adherence to its policies.	B	B	B	B
Improv-2	The ITCA shall establish a checklist for the auditing of the appointed evaluation laboratories.	B	B	B	B
Improv-3	The ITCA shall periodically audit the laboratories at appropriate intervals to ensure laboratories uphold necessary capabilities.	B	B	B	B
Improv-4	The ITCA shall establish an auditing procedure	B	B	B	B

# Interoperability Process Reference Manual (IPRM)

	and implement audits to verify that product interoperability is maintained after the product passes the testing and certification programs and enters the market.				
Improv-5	The ITCA shall have processes in place, including corrective and preventative actions, which results in continual improvement of their testing and certification programs.	B	B	B	B
Improv-6	The ITCA shall be in constant communication with the standards writing committees to create a feedback loop. For example, the ITCA should define a process to communicate the TSS test results back to the SSOs and stakeholders.	B	B	B	B
Improv-7	The ITCA shall provide a forum for feedback to be received from a stakeholder, interested business party and use case in order to improve its interoperability best practices.	B	B	B	B
Improv-8	It is preferred that ITCAs have a method for actively soliciting interoperability feedback on implementations of the standard in order to achieve some level of customer and user-community satisfaction on that feedback.	B	B	B	B

**Table 4 – Interoperability Improvements Process Requirements**

484

485

486

## 8.6 Cyber Security

487

The Cyber Security section outlines the requirements which shall be used by the ITCA to validate the security-related components of the interoperability testing program.

488

# Interoperability Process Reference Manual (IPRM)

489

Sec-x	Cyber Security Improvements Process Requirements Description	ITCA Category			
		I	II	III	IV
Sec-1	The ITCA shall define the procedures and processes which will be used to validate interoperability cyber security requirements.	B	B	B	B
Sec-2	The testing and certification program shall ensure that cyber security functional performance requirements are defined, and test cases designed to evaluate the requirements.	B	B	B	B
Sec-3	Where applicable, the ITCA shall have a process in place to select and implement a Digital Certificate Issuance mechanism that may include the election of a Certificate Authority. The energy service providers can use this certificate for authentication that a given product has actually been certified. <sup>25</sup>	O	B	B	B <sup>25</sup>
Sec-4	The ITCA shall be responsible for certificate management including issuance, maintenance and policing. The ITCA can choose to outsource this responsibility as long as they remain responsible for the interoperable outcome. <sup>25</sup>	O	B	B	B <sup>25</sup>
Sec-5	The ITCA shall implement a process to qualify testing personnel at an appropriate level for their cyber security test training and experience.	B	B	B	B
Sec-6	The ITCA shall specifically require a test methodology that includes widely-accepted stress testing	B	B	B	B

<sup>25</sup> Optional for ITCAs that result in interfaces and not result a physical product.

# Interoperability Process Reference Manual (IPRM)

	processes including static analysis and penetration testing.				
Sec-7	The ITCA shall assure that cyber security models are policy driven, and testing shall also be based on policy settings.	B	B	B	B
Sec-8	The ITCA shall ensure that processes are in place for vendors to submit threat analysis as part of the certification process.	B	B	B	B
Sec-9	The ITCA shall leverage and align with existing security test programs.	B	B	B	B
Sec-10	The ITCA shall ensure that processes are in place to incorporate component-based cyber security concepts in the testing program.	B	B	B	B
Sec-11	The ITCA shall ensure that all business, system, and technical interests are represented in the testing program.	B	B	B	B

**Table 5 – Interoperability Cyber Security Process Requirements**

490

491

# Interoperability Process Reference Manual (IPRM)

## 492 9.0 Best Practices For Interoperability and Conformance Test 493 Construction

494 This section provides best practices and guidelines for ITCAs in their development and operation of  
495 interoperability and conformance testing programs. The recommendations provided in this section  
496 were generated based on input from experienced testing organizations that have evolved interoper-  
497 erability and conformance programs through lessons-learned in executing tests for both software  
498 and hardware applications.

499

500 This section addresses general testing policies, test suite specifications (TSS) and test profile at-  
501 tributes. The recommendations may not apply directly to all testing applications; however, they  
502 should be considered for interoperability and conformance test programs as these practices have  
503 proven to be valuable in executing a broad cross-section of program types. Each ITCA should  
504 evaluate how these recommendations, observations and practices apply to their specific programs,  
505 and incorporate the recommendations into their programs where applicable.

506

507

### 9.1 General Test Policies

508

509

510

511

512

513

514

515

516

517

518

- Product vendors need to know if their products are eligible for testing and certifica-  
tion, and how to prepare for certification. In many cases, product vendors may be  
required to prepare specific test environments (i.e. GUI applications to access low-  
level APIs, test scripts, supported browsers, dedicated test hardware, samples,  
etc.) in order to conduct testing of the standard and all underlying software. Ad-  
vanced knowledge of certification processes helps set expectations of vendors to  
prepare a product for certification.
- Final Test Reports should include at a minimum:
  - Test completion dates
  - Test expiration dates as defined by the Certification Body
  - Product name / version / release tested

# Interoperability Process Reference Manual (IPRM)

- 519                   ▪ Type of tests (i.e. interoperability or conformance)
- 520                   ▪ Test script version information
- 521                   ▪ Standards version information
- 522                   ▪ Technique(s) used for a test including standards and procedures followed
- 523                   ▪ Test profile used or a list of test cases if a complete test profile is not used
- 524                   ▪ Test equipment used, and all equipment traceability statements.
- 525                   ○ Some Certification Bodies have perishable Interoperability Certifications as a best
- 526                   practice. Criteria may include expiry dates, and may be dependent on release of
- 527                   new standards or products.
- 528                   ○ A certified interoperable product shall be conformant to the standard unless full
- 529                   conformance causes interoperability issues. In such cases, the issue should be
- 530                   reported back to the ITCA so corrective action can be taken.
- 531                   ○ The level of Interoperability and Conformance testing is always a trade-off be-
- 532                   tween cost and test coverage. It is highly recommended that the ITCA perform a
- 533                   cost-benefit analysis on the degree of coverage associated with the test for both
- 534                   conformance and interoperability against the cost to test. In determining the test
- 535                   coverage, the security and safety concerns along with appropriate NERC / similar
- 536                   requirements should be considered paramount in determining the coverage as-
- 537                   sessment.
- 538                   ○ Proper test tools produce reliable, repeatable and traceable test results. Such
- 539                   tools require validation processes, test suites, tool documentation, test reports,
- 540                   calibration certificates and other relevant artifacts. The validation of the test tools
- 541                   must be performed against a defined sample of software and / or hardware imple-
- 542                   mentations under test. Refer to ISO / IEC 17025 for more detail on the use of
- 543                   qualified and calibrated test tools.

544  
545

## 9.2 Test Suite Specification (TSS)<sup>3</sup>

# Interoperability Process Reference Manual (IPRM)

- 546
  - 547
  - 548
  - 549
  - 550
  - 551
  - 552
  - 553
  - 554
  - 555
  - 556
  - 557
  - 558
  - 559
  - 560

  - 567
  - 568
  - 569
  - 570
  - 571
  - 572
  - 573
- A common TSS should be established when one or multiple test labs are deployed to test the same standard and / or profile. If unique test procedures are required to support a test suite, then they should also be defined.
  - The TSS should be test tool agnostic.
  - The TSS should be subject to revision control including revision history, revision numbering, and a defect / expansion management process. The TSS should clearly identify the test purpose, references, resource requirements, test setup, procedures, observable results and possible problems / lessons learned with the test approach. Observables should clearly identify pass / fail / indeterminate requirements and informational elements.
  - The TSS should clearly define any conventions that will be required to achieve interoperability.
  - The TSS should restrict cardinality and define the exact attributes and associations required for interoperability.
  - The TSS should remove or clarify all ambiguities and any areas of the standard that may be interpreted differently between two or more interoperable systems.
  - The TSS should be a standard and managed as such by an SSO. The documentation should include scope, date of issue, revision, change control, and methods to feedback implementer's results.
  - The TSS should have accompanying tools to validate data and data structures contained in, or produced by, the test.
  - Test cases should have clear mappings to feature-sets, use-cases, and requirements.
  - The TSS should have a way to feedback the results of the testing back to the profile.
  - The TSS should ensure all areas of the interoperability and conformance testing are sufficiently defined and documented such that the test can be repeated.

# Interoperability Process Reference Manual (IPRM)

- 574           ○ The TSS should define the test data required to execute the test cases. The TSS  
575           should define any test stub required to execute messages that will generate nega-  
576           tive responses.
- 577           ○ The TSS should identify interoperability issues arising from ambiguities in the  
578           standard, and establish requirements sufficient to prevent those interoperability is-  
579           sues.

## 9.3 Attributes of a Test Profile in lieu of complete TSS

- 581
- 582           ○ Must be a subset of the TSS
- 583           ○ Specifies mandatory and optional elements
- 584           ○ Specifies all restrictions
- 585           ○ Cannot add to the standard, but can only restrict the standard
- 586           ○ Define the type of profile (i.e. message, model or implementation) and provide a  
587           name for the profile that clearly defines the objective / scope of the profile and the  
588           use-cases it is designed to test
- 589           ○ Is a companion standard or is submitted to the SSO for progression as a compan-  
590           ion standard

599 **ISO Guide 67 - Conformity assessment - Fundamentals of product certification**

600

# Interoperability Process Reference Manual (IPRM)

## 601 11.0 Glossary of Terms

602 **Accrediting Body** – Organization that formally evaluates processes of test laboratories or certifi-  
603 cation bodies with respect to specific standard(s) or specification(s).

604 **Application Profile** - A selected subset of the product and / or standard which can be used to im-  
605 plement a particular feature set or use case scenario.

606 **Attestation** - Issuance of a statement that fulfillment of specified requirements has been demon-  
607 strated.

608 **Certificate** – Unique identifier of a particular product. It applies to both software and hardware  
609 products. The certificate can be a physical or digital artifact (e.g., X.509 PKI schemes require digital  
610 certificates).

611 **Certification** – Third-party attestation related to products, processes, systems or persons.

612 **Certification Bodies (CBs)** – The entity responsible for certifying that products have fulfilled the  
613 requirements of a standard or specification.

614

615 **Compliance Folder** - The set of test evidence, usually including test data, test report, product in-  
616 formation, and review records. The folder serves as the record of an implementation fulfilling all  
617 requirements of a certification test program.

618

619 **Compliant Portion Description (CPD)** – A CPD is a definitive manifest of all mandatory and op-  
620 tional features implemented in a certified product. The CPD is generally used by product designers  
621 to judge:

- 622
- 623 • Conformance of an implementation,
  - 624 • Completeness of a system composed of pre-certified sub-components by compar-  
625 ing each of the CPDs of those sub-components.
  - 626 • Interoperability of two products based on matching feature sets as described by  
627 their respective CPDs.

627 For example, a designer can compare the CPD with the test requirements to determine the level of  
628 conformance of a product to a specification. When designing a product composed of pre-certified

# Interoperability Process Reference Manual (IPRM)

629 sub-components, the respective CPDs will serve as selection criteria to design the complete prod-  
630 uct. The CPD also helps to judge the level of interoperability that can be expected from interac-  
631 tions between two independent implementations. A client service and a server function can be re-  
632 viewed for their expected level of interoperability solely based on their respective CPDs.

633 **Conformance Certification** – A third-party attestation that a product conforms to a standard or  
634 specification.

635 **Conformance Testing** – Determines whether an implementation conforms to the standard as writ-  
636 ten. This is done by evaluating the implementation with a test tool such as an emulator, test har-  
637 ness, golden unit, etc.

638 **Feature set** – A feature set is a particular characteristic of a product based on a particular use  
639 case scenario. For example: signaling price is a feature set.

640 **First Party Testing** – is when an implementer self-tests their own product. This is usually permitted  
641 after a technology has matured to where sufficient tools and specifications enabling first party test-  
642 ing are available to all vendors.

643 **Inheritance** – Those actions required to evaluate the compatibility of a proposed inherited design  
644 including products, subsystem functions and design requirements.

645 **Interoperability** – Ability of a product or system to work with or integrate with another product or  
646 system based on defined business requirements.

647 **Interoperability Testing** – Connects two or more implementations together and determines  
648 whether they can successfully communicate. Significantly different from conformance testing, it is  
649 often possible for two systems that conform to the standard to be unable to communicate. If they  
650 can communicate, it is possible that they cannot perform any useful functions. These situations  
651 arise because the implementations have conflicting interpretations of the specification, or because  
652 they have chosen conflicting options within the standard. A particular form of interoperability test-  
653 ing is application testing, in which there is a specification for the particular use of standard that can  
654 be tested.

655 **Implementation Under Test (IUT)** – The implementation subject to testing. Covers System Under  
656 Test (SUT) and Device Under Test (DUT)

# Interoperability Process Reference Manual (IPRM)

657 **Multi-vendor and Multi-product Testing Event** – An interoperability test of products with other  
658 peer products. The outcome of the testing is used to improve both products and the specification.

659 **Performance / Protocol / Proforma Implementation Conformance Statement (PICS)** – Defines  
660 all mandatory and optional feature sets of a specification that can be used to implement a product.

661 **Platform level communications protocol** - In the IPRM, platform level communications protocols  
662 are integrated products based on standards only associated with layers 1 and 2 of the OSI layer.  
663 (e.g., Wi-Fi platform)

664 **Qualified Product Notification (QPN)** – A certificate and accompanying explanatory document  
665 issued by the ITCA as a record when a product has fully satisfied the requirements of the testing  
666 and certification program. The QPN details all supported feature sets verified by the program.

667 **Record of Work** - The material evidence of any work or task, such as test data or test report.

668 **Second Party Testing** – Testing activities performed by buyers and users.

669 **Security Testing** – Analyzes whether the implementation correctly makes use of any security fea-  
670 tures from the standard or other security features available in the product. This is the most difficult  
671 type of testing program since it must evaluate whether the system has vulnerabilities, which are not  
672 always obvious.

673 **Standards Setting Organizations (SSOs)** - An association whose primary activities are develop-  
674 ing, coordinating, promulgating, revising, amending, re-issuing, interpreting, or otherwise maintain-  
675 ing standards. A Standards Developing Organization is one form of a Standards Setting Organiza-  
676 tion. Example SSOs including International Organization for Standardization (ISO), International  
677 Electro technical Commission (IEC), Institute of Electrical and Electronics Engineers (IEEE),  
678 American National Standards Institute (ANSI), etc. An SSO can also be an industry trade associa-  
679 tion that develops industry standards such as the ZigBee Alliance.

680 **Static Conformance Review** – A review of designed feature sets versus the specified PICS to  
681 determine the extent to which the features are supported by the IUT. This is the first step when a  
682 product enters a testing program. Generally the test lab requests that the implementer declare all  
683 supported feature sets in a product. This information is used to create the test plan for that product.

# Interoperability Process Reference Manual (IPRM)

- 684 **Testing and Test Control Notation (TTCN)** - A formalized test scripting language used to describe  
685 communication protocol test cases per ISO / IEC 9646.
- 686 **Test Campaign** - A series of tests for a particular product out of the TSS, based on the running  
687 Test Profile group and the Test Plan, derived from the Test Case Reference List.
- 688 **Test Cases** – A set of tests to verify a particular feature set. There are many ways to test a feature  
689 set, with each of those representing a test case. Generally, a program defines all possible test  
690 cases in the test specification document.
- 691 **Test Case Reference List** – A current master list of all tests that are to be included into a product  
692 test plan. This list also indicates the time variable applicability of each test by reflecting those tests  
693 which are no longer valid, and those that are not currently valid but are scheduled to become active  
694 in the near future. This helps a product implementer in preparing fully conforming and interoper-  
695 able products for an upcoming launch.
- 696 **Test Harness** - Collection of software, test data, and hardware configured to test a product by op-  
697 erating it under varying conditions and monitoring its behavior and output.
- 698 **Test Interface** - The programmatic application interface to enable communication between a test  
699 harness and system or device under test.
- 700 **Test Plan** – A Test Plan is a list of applicable tests for a specific product and is derived from the  
701 Test Case Reference List.
- 702 **Test Procedure** – A stepwise test method of a particular test case. An example of a test procedure  
703 can be the steps needed for an Energy Services Interface (ESI) to send price signals, which may  
704 include configuring the time information, updating price tables, etc.
- 705 **Test Profile or Profile** - A select subset of a product and / or standard to implement a particular  
706 test of a feature or a use-case test. Test Profiles evaluate a subset of a TSS and are used to target  
707 specific areas of product interoperability.
- 708 **Test Resource** - Any information, equipment, material, and support required to implement testing.
- 709 **Testing** – According to EN 45020, testing is defined as “the technical operation that consists of the  
710 determination of one or more characteristics of a given product, process or service according to a  
711 specified procedure”.

# Interoperability Process Reference Manual (IPRM)

- 712 **Testing Laboratories (TLs)** – Test service providers for a standard or specification.
- 713 **Test Suite Specification (TSS) or Test Spec-** Consists of a suite of tests, categorized into logical  
714 functional areas, such as use cases or well-defined features. Each test suite consists of many re-  
715 lated test cases corresponding to a particular feature set or use case. Test cases would include  
716 both valid and invalid behavior tests. Each test case is further described step-by-step with test pro-  
717 cedures and well defined pass / fail / indeterminate criteria, along with references.
- 718 **Test Suite-** A collection of related test cases. A test suite can be put together to test a feature set.  
719 A pricing test case would be in a “price test suite” but a messaging test case would be in a “mes-  
720 saging test suite”.
- 721 **Third Party Testing** – Testing activities performed by organizations independent of first or second  
722 parties.
- 723 **Use Case** - A description of a system’s behavior as it responds to a request that originates from  
724 outside of that system
- 725

# Interoperability Process Reference Manual (IPRM)

## Annex

726

727

### 728 **12.0 17025 and ISO Guide 65 Overview**

729 General laboratory and certification body criteria used for accreditation are described in two docu-  
730 ments: ISO / IEC 17025, General Requirements for the Competence of Testing and Calibration  
731 Laboratories, and ISO Guide 65, General Requirements for Bodies Operating Product Certification  
732 Systems. These two documents are widely used across various industries and applicable for Smart  
733 Grid testing and certification programs. ISO 17025 is focused on test laboratories and contains  
734 requirements that labs need to demonstrate that they operate a management system, are techni-  
735 cally competent, and are able to generate technically valid results. It incorporates all requirements  
736 of ISO 9001 that are relevant to testing services and facilitates acceptance of test results from ac-  
737 credited laboratories. Accreditation bodies apply these requirements in their laboratory assess-  
738 ments.

739

### 740 **12.1 ISO – 17025**

741 ISO 17025 can be applied to any testing lab operation, whether independent (i.e. third-  
742 party) laboratories or in-house laboratories operated by manufacturers for their own inter-  
743 nal product testing. The advantage of applying ISO 17025 for Smart Grid testing opera-  
744 tions is that many labs have already pursued and achieved compliance for selected as-  
745 pects of the services they offer, and can simply expand their scope of accreditation to en-  
746 compass new services necessary to support Smart Grid interoperability. This approach  
747 will build on common best practices used across the testing industry, speeding implemen-  
748 tation and avoiding unnecessary creation of redundant processes.

749

750 ISO 17025 focuses on two major areas of laboratory operations: 1) management require-  
751 ments and 2) technical requirements. The management requirements address issues such  
752 as a lab's documented practices (i.e. both administrative and technical), impartiality of the

# Interoperability Process Reference Manual (IPRM)

753 lab in its operations, responsibilities for continuous improvement and issues resolution,  
754 and the active support and involvement of lab management in assuring commitment to  
755 complying with these criteria.

756  
757 The technical requirements focus on areas such as ensuring that lab staff are competent in  
758 performing their testing duties, assuring that the lab environment is adequate for services  
759 performed, assuring that test plans and other necessary operating instructions are docu-  
760 mented and available, and that necessary equipment and software used for testing is cali-  
761 brated, maintained and appropriate for its intended usage.

762  
763 The criteria described in ISO 17025 is extensive and the brief description above simply  
764 provides a high level view of some of the key elements that labs need to address in attain-  
765 ing accreditation.

766  
767 The technical scope of accreditation is specific to the selected tests / services for which the  
768 lab applies for evaluation. Evaluations for compliance can be performed by a number of  
769 different accrediting bodies, and there are global and regional agreements in place that  
770 provide for broad acceptance of an accreditation once attained.

771

## 772 **12.2 ISO Guide 65**

773 ISO Guide 65 is focused on certification bodies but parallels many of the same concepts  
774 applied to test laboratories. There are general criteria that assure that the organization is  
775 non-exclusionary, open and without conflict of interest. Documented administrative poli-  
776 cies and processes, as well as documented technical requirements and specifications for  
777 certification are among the required criteria. Criteria is also included to assure that proce-  
778 dures are in place to describe the granting of certifications, as well as ongoing mainte-  
779 nance, extensions and terminations of certifications once granted. Personnel qualifications

# Interoperability Process Reference Manual (IPRM)

780 are addressed for those involved in the evaluation and decision making process associ-  
781 ated with the organization's certifications. As in the case for ISO 17025, this is only a brief  
782 description of highlights associated with the more extensive criteria described in the docu-  
783 ment.

784

## 785 **12.3 Testing Programs**

786 This section is informational only. The goal is to demonstrate how some of the require-  
787 ments are being used by various ITCAs. This is not an endorsement of any of the following  
788 programs but rather examples to help provide context.

789

### 790 **12.3.1 Bluetooth SIG**

791 Bluetooth products are low-cost, low powered cable replacement products, primar-  
792 ily aimed at low-rate voice / data applications in portable telecommunication prod-  
793 ucts. Popular application profiles include hands-free phones, headset, and stereo  
794 cable replacements. Bluetooth products are widely known for their interoperability,  
795 and billions of products have reached the market.

796

797 The Bluetooth SIG has been operating a testing and certification program for  
798 roughly ten years. The design of the program is described in the Program Re-  
799 quirements Document (PRD). Throughout the history of the testing and certifica-  
800 tion program, a well defined PRD version has been in effect.

801

802 The current Bluetooth SIG PRD calls for physical layer testing with a validated test  
803 system at the Bluetooth Qualified Test Facilities (BQTF), and upper layers and pro-  
804 file applications are tested by a test harness issued to members by the Bluetooth  
805 SIG. The Bluetooth SIG operates as an ITCA for this wireless technology, and has  
806 the Bluetooth Qualification Administrator, BOA, as the individual in charge of the

# Interoperability Process Reference Manual (IPRM)

807 PRD administration and interoperability assurance. The BQA and the PRD en-  
808 sures that the Bluetooth Logo signifies a high-level of interoperability and rich user  
809 experience.

810  
811 The PRD has defined a testing regime involving various levels of testing, including  
812 First, Second, and Third-party testing. The testing is defined in the Test Case Ref-  
813 erence List (TCRL), and issued periodically to the industry to define the level of  
814 testing depending on the content. For example, the radio layer has been and still  
815 is a third-party test, requiring a fully validated test system running a Testing and  
816 Test Control Notation (TTCN) radio tester with full test control interface and auto-  
817 mated testing. In the past, baseband, link manager and protocol conformance  
818 tests were designated as third-party testing, with a specialized protocol confor-  
819 mance tester. However, these tests have become implementable by a single  
820 common software test system issued by the Bluetooth SIG lead laboratory function  
821 since PRD 2.0.

822  
823 The BQA chairs the Bluetooth Technical Advisory Board (BTAB), and issues aris-  
824 ing in the market are handled by the BQA directly through the BTAB or other cor-  
825 rective feedback processes. The Bluetooth SIG maintains a Qualified Product  
826 Listing, and issues for each product a Qualified Product Notice (QPN) that defines  
827 exactly the conformance and interoperability feature set verified by a static con-  
828 formance check of the PICS, and objectively verified with the test harnesses. The  
829 BQA oversees verification and auditing process of the BQTF organizations. The  
830 BQTF organizations are additionally required to maintain accreditation based on  
831 ISO Guide 17025.

832

# Interoperability Process Reference Manual (IPRM)

833 Additional mechanisms include personnel qualifications of Bluetooth Qualification  
834 Experts (BQEs), formerly known as Bluetooth Qualification Body's (BQBs). Com-  
835 panies are required to maintain a Compliance Folder, detailing the conformance  
836 and interoperability evaluation record. Products are comprised of smaller Blue-  
837 tooth components tested separately, and integrated in a manner that maintains in-  
838 teroperability through a Compliant Portion inheritance. The Bluetooth SIG holds  
839 regular "UnPlug Fests", allowing various vendors to test interoperability in a devel-  
840 opment environment early in the product and specification lifecycle.

841

## 12.3.2 WiMAX Forum

842

843 WiMAX is a communication technology that enables high-speed wireless data  
844 communication backhaul over large distances between fixed base stations, and  
845 similar high-speed links from base stations to mobile products. It is also known as  
846 a "4G" network, and utilizes the IEEE 802.16e standard for the physical and me-  
847 dium access control (MAC) sub-layer. Some AMI networks utilize WiMAX links.

848

849 The WiMAX Forum is an ITCA for the WiMAX standard, and the IEEE 802.16e  
850 physical and MAC layer technologies. WiMAX maintains a testing and certification  
851 administrator to manage the logo program. A commercial lead lab is operated out  
852 of Malaga, Spain. The WiMAX Forum has gone through extensive accreditation  
853 processes to select a single testing laboratory in each country, and to provide an  
854 economically viable incentive for the labs to participate and facilitate in the growth  
855 of the interoperable technology.

856

857 The WiMAX Forum has structured its technology development in stages, and certi-  
858 fied products in "waves" synchronized with the product stages. All products are  
859 rigorously tested for conformance, regulatory, and interoperability requirements

# Interoperability Process Reference Manual (IPRM)

860 with a validated test set supplied by the lead lab. The test labs participating in the  
861 WiMAX certification program are mandated to equip themselves with a validated  
862 test system, and manufacturers are encouraged to verify for pre-certification status  
863 by testing with the same equipment either by themselves or at the accredited labo-  
864 ratories. All test cases are clearly defined in a test case reference list, and tests  
865 are categorized according to First, Second, and Third-party tests. Logo certifica-  
866 tion tests third-party accredited test houses. All accreditation of test houses are  
867 performed directly by a team of experts selected by the WiMAX Forum. The Wi-  
868 MAX Forum further implements personal qualifications in the form of a WiMAX  
869 Qualification Body, who “signs-off” on the test results from the test laboratories.  
870 This model provides flexibility to deal with complex interoperability issues. All test  
871 labs are required to obtain ISO Guide 17025 accreditation under their respective  
872 national auditing schemes defined by their country.

873  
874 Manufacturers and test houses are required to maintain a compliance folder that  
875 serves as a Record of Work for the logo testing.

876  
877 The WiMAX Forum has specified and operated its conformance and interoperabil-  
878 ity program as described by their Certification and Interoperability Reference Man-  
879 ual.

880

### 881 **12.3.3 Wi-Fi Alliance**

882 The Wi-Fi Alliance is an industry organization promoting interoperable products  
883 utilizing the IEEE 802.11 a / b / g / n physical and MAC layer standards. Initially  
884 defined as an Ethernet cable replacement technology, it has progressed to include  
885 embedded products and mesh networks. Some implementations of Advanced Me-

# Interoperability Process Reference Manual (IPRM)

886 tering Infrastructure (AMI) systems rely on a Wi-Fi-based mesh transport layer for  
887 the communication link to the smart meter.

888

889 The Wi-Fi Alliance maintains multiple competing laboratories to provide testing  
890 services around the globe. A single lead laboratory is maintained by the Wi-Fi Alli-  
891 ance to develop test cases, evaluate test systems, and in general to be the center  
892 of technical competence for the industry regarding conformance and interoperabil-  
893 ity. An interoperability test harness is defined by and supplied by the Alliance. A  
894 certification administrator oversees the program.

895

896 Wi-Fi Alliance laboratories are required to obtain ISO 17025 accreditation, and go  
897 through a rigorous auditing process before being selected by the Alliance as a cer-  
898 tified laboratory. The Wi-Fi Alliance holds regular test events to help facilitate  
899 standard development and interoperability between vendors.

900

901 A product manufacturer can obtain a Wi-Fi logo only after undergoing rigorous  
902 testing at a Wi-Fi Alliance-selected laboratory, and providing test report evidence  
903 to the Wi-Fi Alliance certification administration.

904

905 The Wi-Fi Alliance coordinates with the ZigBee Alliance in support of the Smart  
906 Energy Profile 2.0 standard for Smart Grid products in the home.

907

## 908 **12.3.4 HomePlug Alliance**

909 The HomePlug Alliance is an industry organization promoting interoperable prod-  
910 ucts utilizing the IEEE P1901 power-line communication standard. The Alliance  
911 maintains several testing laboratories to perform conformance and interoperability  
912 testing of the physical / MAC layer based on well-defined test cases and test har-

# Interoperability Process Reference Manual (IPRM)

913 nesses. Several different Phy / MAC layer platforms are supported by the Alliance  
914 but not necessarily meant to interoperate across platforms.

915

916 The HomePlug Alliance coordinates with the ZigBee Alliance in support of Smart  
917 Energy 2.0 standard for Smart Grid products in the home.

918

## 919 **12.3.5 ZigBee Alliance**

920 ZigBee Alliance oversees the development of a class of products utilizing Personal  
921 Area Network (PAN) technology. Similar to Bluetooth SIG, the ZigBee Alliance  
922 handles the interoperability of full application profiles leveraging the IEEE 802.15.4  
923 physical / MAC layer standard. This is in contrast to WiMAX and Wi-Fi programs,  
924 which are mostly concerned with interoperability of the physical and MAC layer.  
925 The ZigBee Alliance handles multiple application profiles, including Telecom Appli-  
926 cations, Health Care, Home Automation, Commercial Business Automation, Retail  
927 Services, and Smart Energy. The Smart Energy application profile is widely  
928 adopted by smart meter vendors and electric utilities as the basis of two-way  
929 communication between the smart meter and home-area-network (HAN) products.  
930 The Smart Energy application profile is transitioning from 1.x to 2.0, where the sa-  
931 lient feature is not only the support of a ZigBee IP layer, but also other IP-based  
932 technologies, such as Wi-Fi, HomePlug and others.

933

934 The ZigBee Alliance maintains a few commercial laboratories around the globe,  
935 and requires ISO 17025 accreditation and rigorous evaluation of candidate labora-  
936 tories. As with other Alliances, each test laboratory is qualified for a particular plat-  
937 form or application profile testing after undergoing a peer review process. A certi-  
938 fication administrator oversees the logo certification program, and laboratories un-  
939 dergo periodic review of performance.

# Interoperability Process Reference Manual (IPRM)

940

941

Test specifications are defined by the industry working groups and “ZigFests” held to verify the viability and interoperability of the technical and test specification with participation of the test laboratories. Currently, only third-party testing is allowed in the ZigBee Alliance.

945

946

## 12.3.6 OPC

947

### OPC Self-Testing

948

The OPC Foundation first-party testing program includes a test tool provided by the OPC Foundation which produces a signed and encrypted log file. This log file reports the system configuration, product version and results of the test. It also reports what optional features are supported by the product. This log file can be uploaded to the OPC Foundation website where the signature is verified before it is added to the product catalogue.

949

950

951

952

953

954

### OPC Best Practices

955

OPC is a family of specifications that provide software interoperability in the industrial automation space. The OPC Foundation has been running a certification program for 10 years, and has evolved over time based on feedback provided by product vendors and end-users.

956

957

958

959

960

The current certification program has three aspects: 1) self-testing with a tool provided by the OPC Foundation, 2) interoperability workshops where multiple vendors gather and test their products with each other and 3) third-party lab testing. A vendor who completes the self-testing process or participates in an interoperability workshop is eligible to use a ‘Self-Tested’ logo offered by the OPC Foundation. A vendor that completes lab testing is eligible for a ‘Certified’ logo. Certifications expire after 2-3 years and vendors are expected to re-certify their products. The OPC Foundation maintains a product catalogue on its website that lists all products which have passed the certification process.

## 12.3.7 USGv6 Test Program

979

### Overview

980

981

982

983

984

985

986

987

988

989

990

991

992

993

994

The process for developing the certification programs starts during specification development, where a completely functional reference implementation is completed before the specification is released. This process ensures the specification is implementable. When a specification is nearing completion, a separate compliance committee is formed. The compliance committee creates a test document for the specification, and is used to develop the self-testing tool and the lab test procedures. The compliance committee reports any issues that affect testing back to specification committee so the specification can be corrected.

In the White House Office of Management and Budget (OMB) Memorandum 05-22, NIST is tasked to develop a set of technical requirements for IPv6 for use in the Federal Government. In response, NIST published the USG v6 Profile. This document suggests that product testing services are likely needed to ensure the confidence and to protect the investment of early IPv6 adopters. After surveying the existing testing programs, it concludes that a distinct United States Government [USG] testing program is needed, but with the commitment to harmonization and convergence in a broad collaborative user / vendor testing initiative, in which the technical and profiling requirements of the USG can be accommodated.

NIST has established the USGv6 testing program as a way to document products' compliance with USGv6 requirements. The test program makes use of a set of abstract test specifications, each validated against the respective protocol specifications. To be documented as USGv6-compliant, products must be tested against tools validated to these tests, in accredited laboratories. Having implemented and tested their products, develop-

# Interoperability Process Reference Manual (IPRM)

995 ers must make their claims of USGv6 compliance in a systematic and standardized way.  
996 The Supplier's Declaration of Conformance (SDOC) is a tool that offers a flexible means of  
997 constructing these claims, and will be used to document compliance with USGv6 require-  
998 ments.

999  
1000 USGv6 contains a wide range of elements, and the testing program includes components  
1001 that are subject to enhancement and revision over time. Hence it is necessary to have in  
1002 place a scheme to manage the evolution and maintenance of these components that in-  
1003 cludes collaboration with the stakeholders.

1004

## 1005 Stakeholders

1006 **"USG Agencies"** have a primary interest in making sure that IT products with IPv6 capa-  
1007 bilities are available to meet their acquisition requirements. However, they are typically  
1008 more interested in the end product than the testing process.

1009

1010 **"Testing Laboratories"** are central to the USGv6 testing process. Each such laboratory  
1011 seeks accreditation from an ISO 17011 compliant, ILAC signatory, accreditation body. Test  
1012 laboratories may conduct any of the conformance, interoperability or network protection  
1013 testing. First, second and third-party labs are recognized as follows: 1) a first-party lab is  
1014 associated with the product developer, 2) a second-party lab is associated with a USG  
1015 agency and 3) a third-party lab is independent.

1016

1017 **"Test Method Developers"** include open source suppliers (e.g. Tah) and private sector  
1018 developers, who develop IPv6 test methods for conformance and interoperability based on  
1019 the abstract test specifications. In conjunction with test laboratories, test method develop-  
1020 ers take part in inter-laboratory comparisons to make sure that test results for the same  
1021 test using different methods in different labs are equivalent.

1022

# Interoperability Process Reference Manual (IPRM)

1023 "Accreditors" - The role of an accreditor is to assess test laboratories for their compliance  
1024 with ISO / IEC 17025, which are the quality provisions for testing. They also assess the  
1025 technical test methods and technical competence based on NIST SP 500-273.

1026

1027 "IPv6 Device Developers" develop hosts, routers and network protection devices which  
1028 shall be tested according to the IPv6 criteria when offered for sale to the US government.

1029

1030 "NIST and the USG test program" - NIST is a technology agency of the US government  
1031 charged with creating a standard for IPv6 devices, and a means of determining compliance  
1032 to that standard. NIST SP 500-267 is that standard. NIST SP 500-273, together with NIST  
1033 SP 500-281 and this testing program are the means of establishing compliance.

1034

### 1035 13.2.7.3 Processes

1036 Processes associated with USGv6 compliance include testing processes and management  
1037 processes. These processes regulate the development of tests, test methods and accred-  
1038 ited laboratories. All processes are described below.

1039

#### 1040 Conformance Testing

- 1041 • is conducted between the device and / or protocol implementations under test,  
1042 and a special purpose test system.
- 1043 • uses tests described in the published abstract test specifications.
- 1044 • must be performed in a first, second or third-party accredited laboratory.
- 1045 • is the gate required before interoperability testing.

1046

#### 1047 Interoperability Testing

- 1048 • is conducted among several host or router devices under test.
- 1049 • uses tests described in the published abstract test suites.

# Interoperability Process Reference Manual (IPRM)

- 1050                   • must be performed in a second or third-party accredited laboratory.
- 1051                   • is the prerequisite for issuing SDOC for Host / Routers.

1052

## 1053                   **Network Protection Testing**

- 1054                   • is conducted with special purpose test equipment
- 1055                   • uses tests generally described in published abstract test suites
- 1056                   • must be performed in a second or third-party accredited laboratory
- 1057                   • is the prerequisite for issuing SDOC for network protection devices

1058

## 1059                   **SDOC Protection**

1060                   After testing their devices in an accredited laboratory, product vendors will develop

1061                   a Suppliers Declaration of Conformance according to ISO / IEC 17050:2004 that

1062                   serves as indication to purchasers that required testing has taken place. Whether

1063                   a test laboratory wants to offer the service of SDOC creation after testing is a mat-

1064                   ter between the lab and its customer.

1065

## 1066                   **Test Methods and Specifications**

1067                   Test Methods exist for Conformance, Interoperability, and Network Protection test-

1068                   ing. For test specifications use the following link:

1069                   <http://www.antd.nist.gov/usgv6/test-specifications.html>.

1070

## 1071                   **Conformance Test Methods**

1072                   Any accredited test laboratory can offer the conformance test methods, including

1073                   first, second or third-party test labs. Conformance test methods are located at

1074                   <http://www.antd.nist.gov/usgv6/test-meth-c.html>.

1075

## 1076                   **Interoperability Test Methods**

# Interoperability Process Reference Manual (IPRM)

1077 A seemingly intuitive way to do interoperability testing is on a device-by-device ba-  
1078 sis. However in practice, the range of configurable options in the USGv6 profile is  
1079 so flexible that in the end it is better to construct interoperability test suites per Re-  
1080 quest-for-Comment (RFC) and run the required set of tests according to each de-  
1081 vice's configuration. For this reason, the interoperability test methods are struc-  
1082 tured identically with the conformance test methods. The test suites associated  
1083 with these methods are uniquely applicable to interoperability testing. Interopera-  
1084 bility test methods can be found at [http://www.antd.nist.gov/usgv6/test-meth-  
1085 c.html#interop](http://www.antd.nist.gov/usgv6/test-meth-c.html#interop).

1086

## 1087 **Network Protection Test Methods**

1088 Network protection test methods cover firewall, application firewall and intrusion  
1089 detection systems, and may be tested by a second or third-party test lab. Network  
1090 Protection Test methods can be found at [http://www.antd.nist.gov/usgv6/test-  
1091 meth-c.html#npd](http://www.antd.nist.gov/usgv6/test-meth-c.html#npd).

1092

## 1093 **Supplier's Declaration of Conformance**

1094 Suppliers test Host, Router or NPD products in accredited test laboratories. Test-  
1095 ing of different capabilities can occur in different test labs. Each test event and its  
1096 date are recorded in the Supplier's Declaration of Conformance (SDOC). Capa-  
1097 bilities implemented and tested should be correlated with the test methods listed at  
1098 this site. An SDOC template in Excel format is provided to allow for summariza-  
1099 tion of the testing done. The second sheet of this Excel file is the USGv6 version  
1100 1 capabilities checklist, indicating what functions must be supported.

## 1107 IPv6 Forum - IPv6 Ready Logo Program

1108 The IPv6 Forum (<http://www.ipv6ready.com>) IPv6 Ready Logo Program is a con-  
1109 formance and interoperability testing program intended to increase user confi-  
1110 dence by demonstrating that IPv6 is available now and is ready to be used.

1111

1112 The IPv6 Ready Logo Committee mission is to define the test specifications for  
1113 IPv6 conformance and interoperability testing, to provide access to self-test tools  
1114 and to deliver the IPv6 Ready Logo. The Key objectives and benefits of the IPv6  
1115 Ready Logo Program are to:

1116

- 1117 • Verify protocol implementation and validate interoperability of IPv6 prod-  
1118 ucts.
- 1119 • Provide access to free self-testing tools.
- 1120 • Provide IPv6 Ready Logo testing laboratories across the globe dedicated  
1121 to provide testing assistance or services.

1122

## 1123 Process

1124 The process requires vendors to pass 100% for both conformance and in-  
1125 teroperability test specifications. Interoperability requires testing with four  
1126 different interoperable vendor devices.

1127

1128 Allows vendors to either use self-test tools or utilize test laboratory ser-  
1129 vices. No accreditation is required.

1130

# Interoperability Process Reference Manual (IPRM)

1131                               Once the vendors have applied for the Logo, the IPv6 Ready Logo Com-  
1132                               mittee has an administrative process to review and verify the test results.  
1133                               Once approved, the vendor will be added to the Approved List.  
1134                               <https://www.ipv6ready.org/db/index.php/public/>

1135

## 1136                               **12.3.8 System testing**

1137                               System-wide, end-to-end interoperability testing is crucial to build an ecosytem of inter-  
1138                               operating vendor products. As such, the following example has proven to be effective to  
1139                               ensure system wide testing.

1140

### 1141                               **Texas Go-To-Market ZigFest**

1142                               The joint Texas T&D utilities and the ZigBee Alliance has sponsored multiple  
1143                               events to test an end-to-end provisioning and signaling system that connects  
1144                               Smart Meters to HAN products. This has allowed finer interpretation and business  
1145                               use case verification and interoperability with multiple vendor implementations of  
1146                               specified application profiles.
